***Notes:*** Maximum Dry Density for Weldon WC Screenings based on Sor Testing Laboratories Report No. 13-1877 dated 11/6/13.
Maximum Dry Density (gravel corrected) for Tilcon MH DGA based on Sor Testing Laboratories Report No. 13-1334 dated 8/7/13.
Re-used on site historical fill material (Type A) will not be tested for compaction per Specification Section 02315-3.13 A.2.b
Moisture content not to exceed 3% above optimum per Specification Section 02315-2.04C
Bottom of excavation elevation based on Maser survey data (Center Point elevations)
Sample ID RF-01-01 where:

RF = Reduced Frequency
01 = Test Location (as noted on Backfill Compaction Location Figure)
01 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again
= Area subject to re-compaction

Special Instructions by Contractor/Vendor

AMEC's Comments

Checked by Contractor for Project Conformance:
Signed:/Title:
Caroline Panico
Quality Control Manager

**Acceptance Action Code:**

1. No exceptions taken
2. Make corrections noted
3. Amend and resubmit
4. Rejected - see remarks

■ Installation shall proceed only when acceptance code is #1 or #2.
■ Acceptance does not relieve Contractor from responsibility of compliance with all requirements of the Subcontract documents.
■ Acceptance coded 3 or 4 shall be resubmitted unless otherwise indicated.

Notes: Maximum Dry Density for Celgene GDL Cover Soil (CS) based on Vertical 5 Northeast Inc Sample ID 12691 approved in Entact Submittal 112B
Maximum Dry Density for 6 inch lift of Horizon C based on Vertical 5 Northeast Inc Sample ID 12934
Maximum Dry Density for Liberty Structural Fill (SF) based on Vertical 5 Northeast Inc Sample ID 12924 approved in Entact Submittal 117A
Maximum Dry Density for Tilcon Structural Fill (SF) based on Vertical 5 Northeast Inc Sample ID 13163 approved in Entact Submittal 128
Sample ID CS-1-2 Where:
CS=Cover Soil; HC=Horizon C; SF=Structural Fill
1 = Test Location as noted on Compaction Location Figures
2 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again

HC-107 became a Structural Fill test location after the D Street Corridor was widened

# Vibration Monitoring

## Study Area 6 South
## Chromium Remedy

**Prepared by**
**Geocomp Engineering**
**August 13, 2013**

**Geocomp Engineering**
**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**Note**s:

- Activity for the day was sheets driving along 440 North and Jug handle
- Total number of sheets driven was two(2)
- Summary of sheet driving activity is as follows
    - Sheets driving started at 13:39 stopped at 13:42,
    - Started at 13:52 stopped at 13:57,
    - Started at 14:13 stopped at 14:14

Sheet driving activities were stopped early due to complications. Completion time was at 14:14.

**Crack Gauges**:

- Crack guages were checked at the end of day. Crack gauges show no movement.

**NOTES:**

**Summary of Work:**

Twelve sheets were driven in total for the day. The work commenced at 7:50am until 11:30am. The location of the seismograph was changed a total of 4 times to be at the closest distance possible to the utility lines.

A high exceedance was noted at 10:00am while the seismograph was in location 3 along jug handle. Work was stopped briefly. Meanwhile, I checked the crack gauges and did a walk-through of the basement of the diner. No changes were observed. I also checked the reading in the diner's seismograph and it showed a reading of **0.03 in/s** at the time of exceedance which is lower than the **threshold limit** of **0.375 in/s**. Upon the inspection of the geophone, I noticed that the sandbag had moved and geophone was loose. It is most likely that this was the cause of the high reading.

The exact start & stop times that the vibrations occurred were noted, as well as the time that seismograph locations were changed.

Sheet 2 –7:51 to 7:59(pair)

Sheet 3 – 8:11 to 8:12 (pair)

Sheet 4 – 8:23 to 8:24 (pair)

Sheet 5 – 9:11 to 9:12 (pair)

**Location of Geophone moved at 9:16**

Sheet 6 – 9:20 to 9:21 (pair)

**Location of Geophone moved at 9:24**

Sheet 7 – 9:27 to 9:28 (pair)

Sheet 8 – 9:43 to 9:44 (pair)

Sheet 9 – 9:53 to 9:54 (pair)

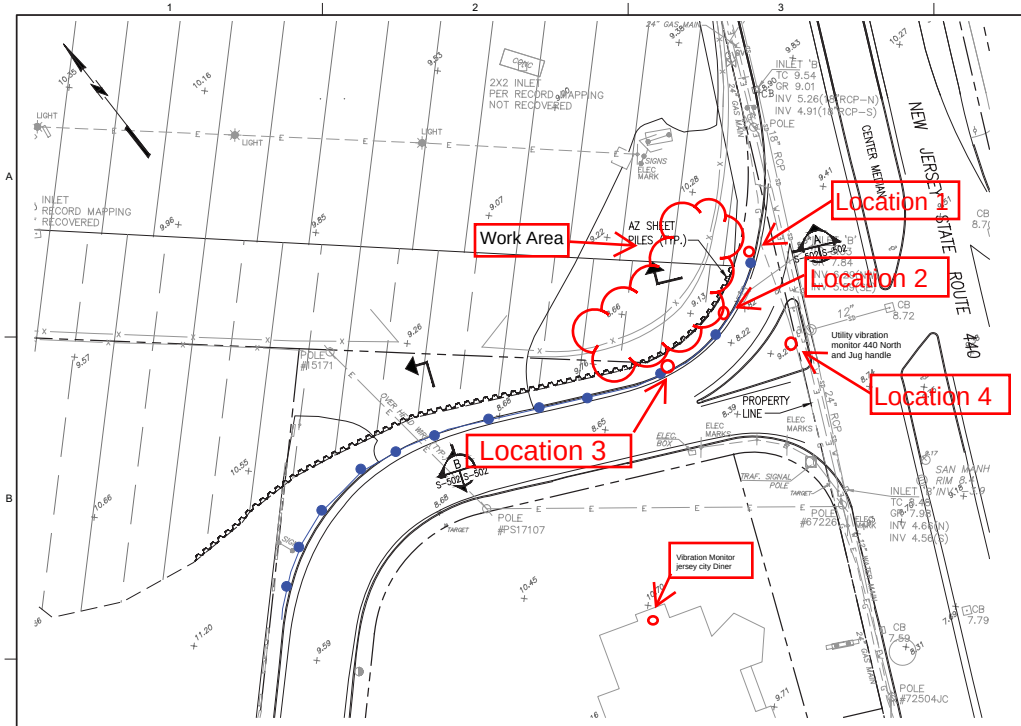
Sheet 10 – 10:01 to 10:01 (pair)

Sheet 11 – 10:25 to 10:26 (pair)

Sheet 12 – 10:32 to 10:34 (pair)

Sheet 13 – 10:44 to 10:44 (pair)

**Location of Geophone moved at 11:02**

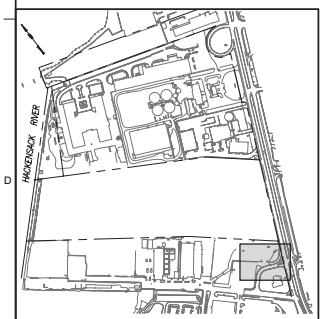


Sheet 13 – 11:02 to 10:24 (pair)

Exceedance:

- Water/Force main Alert limit exceedance at 7:52am 0.72 in/s (Vert) , 0.61 in/s (Long)
- Water/Force main Alert limit exceedance at 9:28am 0.52in/s (Tran) , 0.61 in/s (Vert)
- Water/Force main Alert limit exceedance at 9:43am 0.71 in/s (Vert)
- Water/Force main Alert limit exceedance at 9:53am 0.675in/s (Tran) , 1.57 in/s (Vert), 1.17 in/s (Long)
- Water/Force main limit exceedance at 10:25:43 0.88 in/s (Tran), 0.98 in/s (Vert), 0.55 in/s (Long)
- Water/Force main Alert limit exceedance at 10:25:51am 0.61in/s (Tran) , 0.50in/s(Vert)
- Water/Force main Alert limit exceedance at 10:26am & 10:58am 0.88 in/s (Tran), 1.06 in/s (Vert), 0.85 in/s (Long)

Crack Guages:



Crack gauges were checked in the morning before work began, after the exceedance at 10:00 AM and afternoon after completion of work. There were no movements in cracks.

PPV during the vibration period = 3.25 in/s (Vertical) @ 10:01AM

Note: After the exceedance, inspection of the seismograph showed that the sandbag placed on geophone had moved and wasn't holding geophone in place. This was the cause of the high reading.

# Vibration Monitoring Plan

## Study Area 6 South
## Chromium Remedy

**Prepared by**
**Geocomp Engineering**
**August 15, 2013**

**Geocomp Engineering**
**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

**Summary of Work:**

Ten sheets were driven in total for the day. The work commenced at 1:27PM until 2:43PM. The location of the seismograph was "Location 1" along route 440. The total distance of sheets driven for the day were from sta. 1+52 to sta. 1+94)

One exceedance was noted at 13:29 while the seismograph was in location 1. Distance of the sheet to the underground utility pipe was approximately 11 Feet.

The crack gauges in the diner were checked in the morning before work started and afternoon after completion of work. There were no discernable movements.

The exact start & stop time of vibration was noted. The times are as follows:-

Location 1 approx. 7.5 Feet from edge of sheet.

Sheet 1: Start time 1:27PM, stop time 1:28PM, Sta. 1+52

Sheet 2: Start time 1:42PM, stop time 1:44PM

Sheet 3: Start time 1:50PM, Stop time 1:51PM

Sheet 4: Start time 1:58PM, stop time 1:59PM

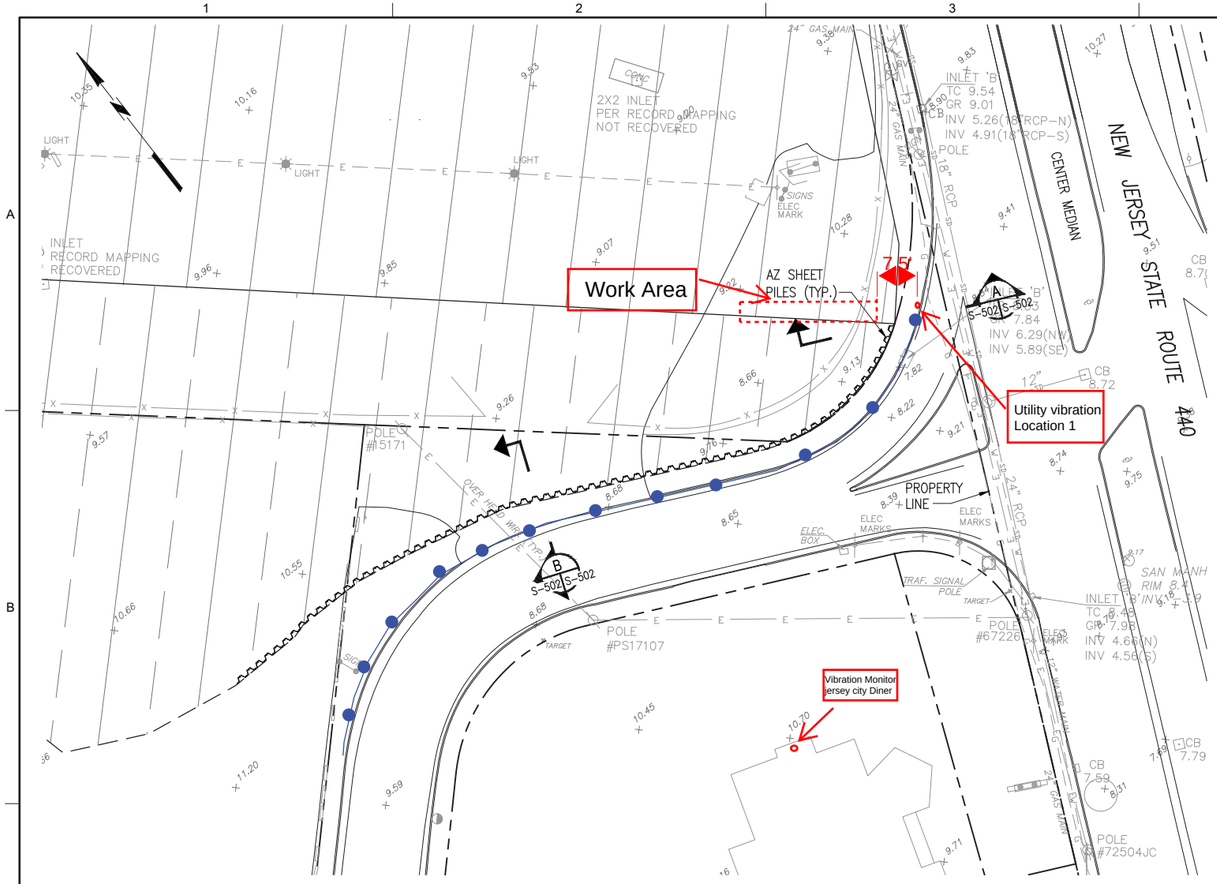
Sheet 5: Start time 2:08PM, stop time 2:09PM

Sheet 6: Start time 2:16PM, stop time 2:17PM

Sheet 7: Start time 2:24PM, stop time 2:25PM

Sheet 8: Start time 2:29PM, stop time 2:30PM

Sheet 9: Start time 2:37PM, stop time 2:38PM

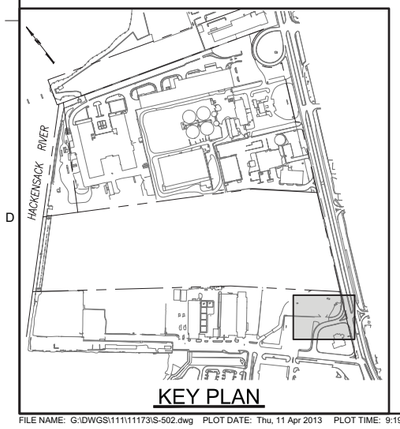


Sheet 10: Start time 2:43PM, stop time 2:43, Sta. 1+94

Exceedance:

- Water/Force main threshold exceedance at 13:29. 0.42 in/s (Vert) & 0.61 in/s (Long)

Crack gauges:



There were no movements in crack gauges.

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

**Summary of Work:**

Nine sheets were driven in total for the day. The work commenced at 9:21AM until 10:22AM. The location of the seismograph was "Location 1" along route 440. The sheets completed today were from Sta. 1+94 to Sta. 2+36.

Sheet driving activity moved from East to West. Seismograph was placed at Location 1, which is approximately 54' east of the first sheet installed for the day. Utility line was located at approximately 57' from first sheet. No exceedances were recorded for the duration of the sheet driving activity. .

The exact start & stop time of the vibratory machine are as follows -

Sheet 11: Start time 9:15AM, stop time 9:16AM, (Sta. 1+94)

Sheet 12: Start time 9:21AM, stop time 9:22AM

Sheet 13: Start time 9:29AM, Stop time 9:30AM

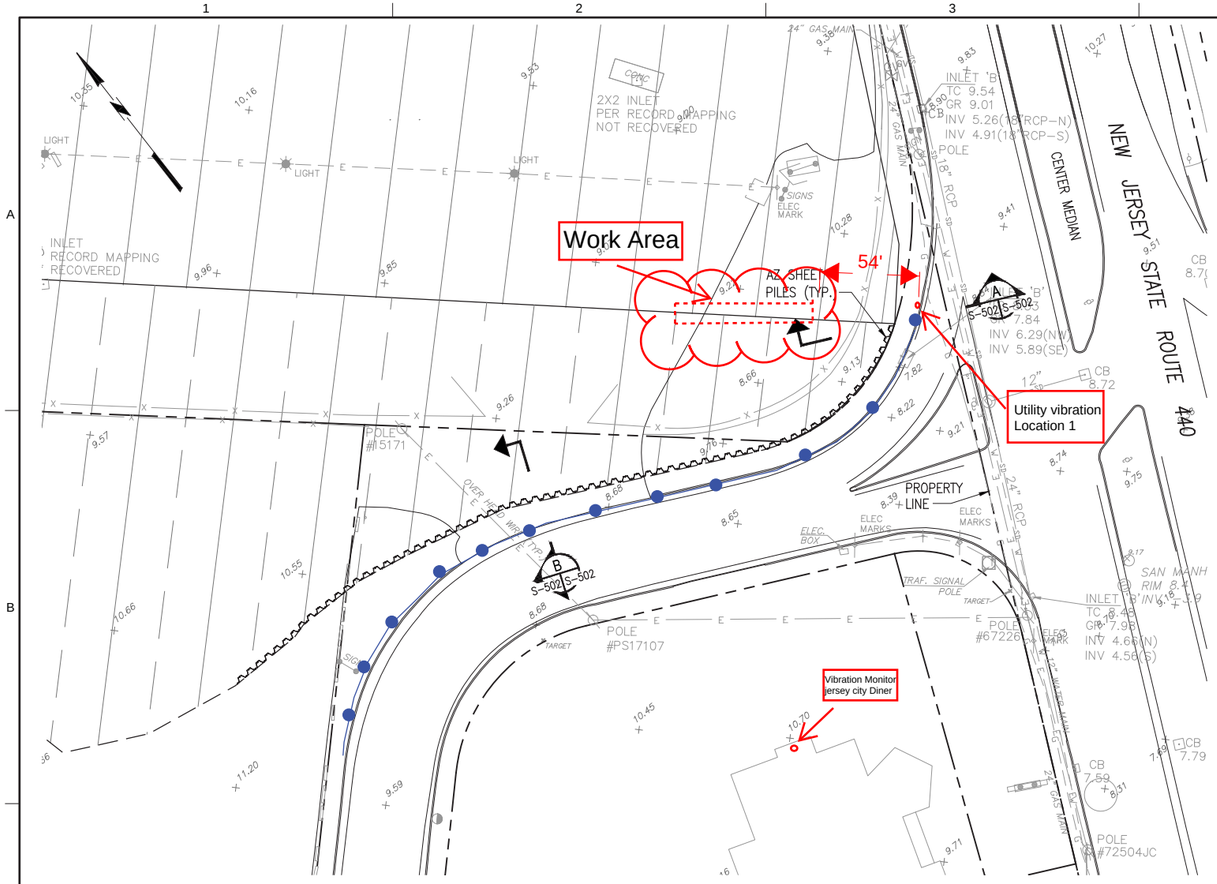
Sheet 14: Start time 9:38AM, stop time 9:39AM

Sheet 15: Start time 9:43AM, stop time 9:44AM

Sheet 16: Start time 9:48AM, stop time 9:49AM

Sheet 17: Start time 10:00AM, stop time 10:01AM

Sheet 18: Start time 10:15AM, stop time 10:16AM

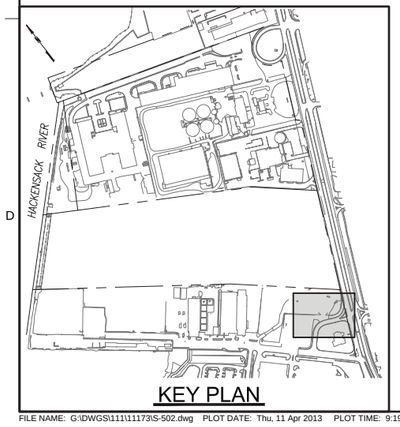


Sheet 19: Start time 10:21AM, stop time 10:22AM, (Sta. 2+36)

Exceedance:

- No exceedances

Crack gauges:



There were no movements in crack gauges.

**August 28, 2013**

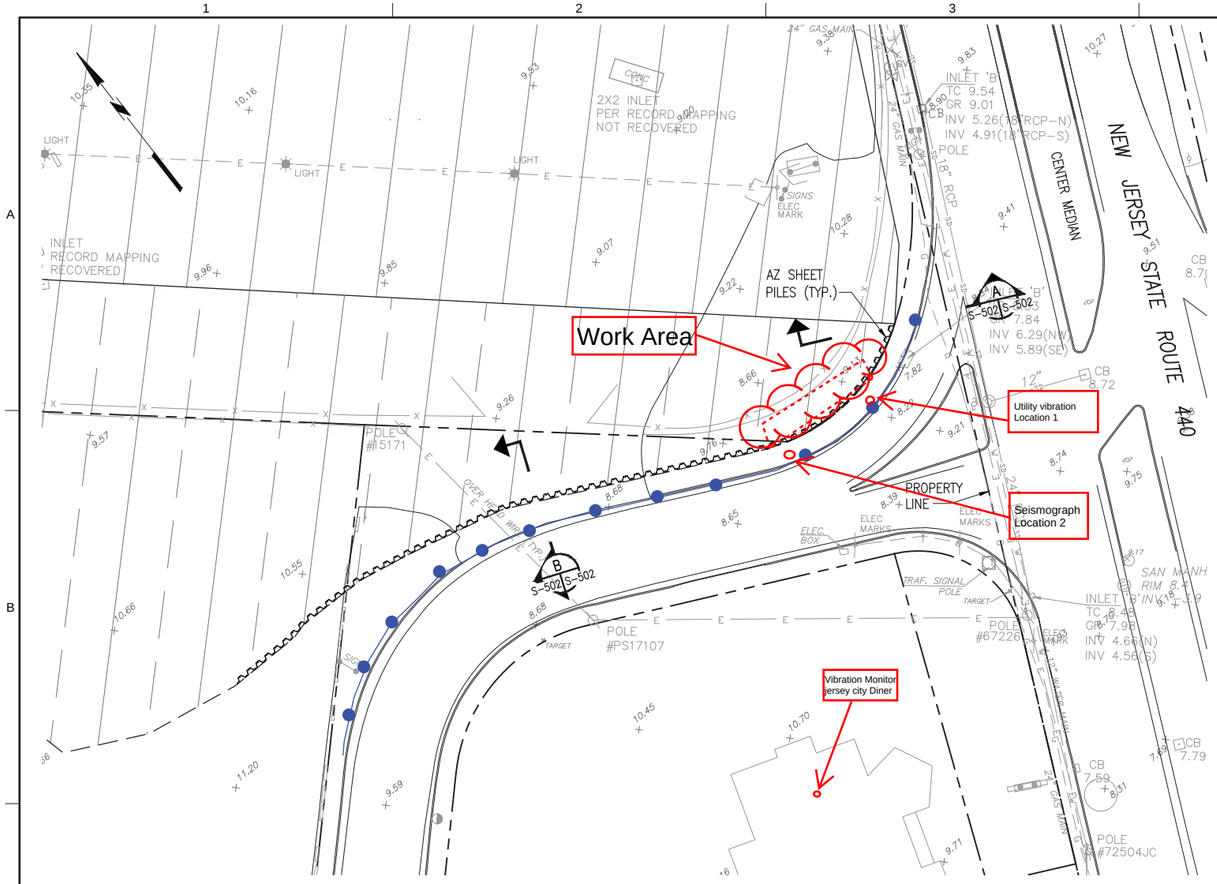
**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

**Summary of Work:**

The vibration work commenced at 9:30AM until 11:50AM. The seismograph was placed along the jug handle at 2 locations. Location 1 is approximately 54' west of the utility lines and Location 2 is further west away from utilities. There were 2 exceedances recorded for the duration of the sheet driving activity.

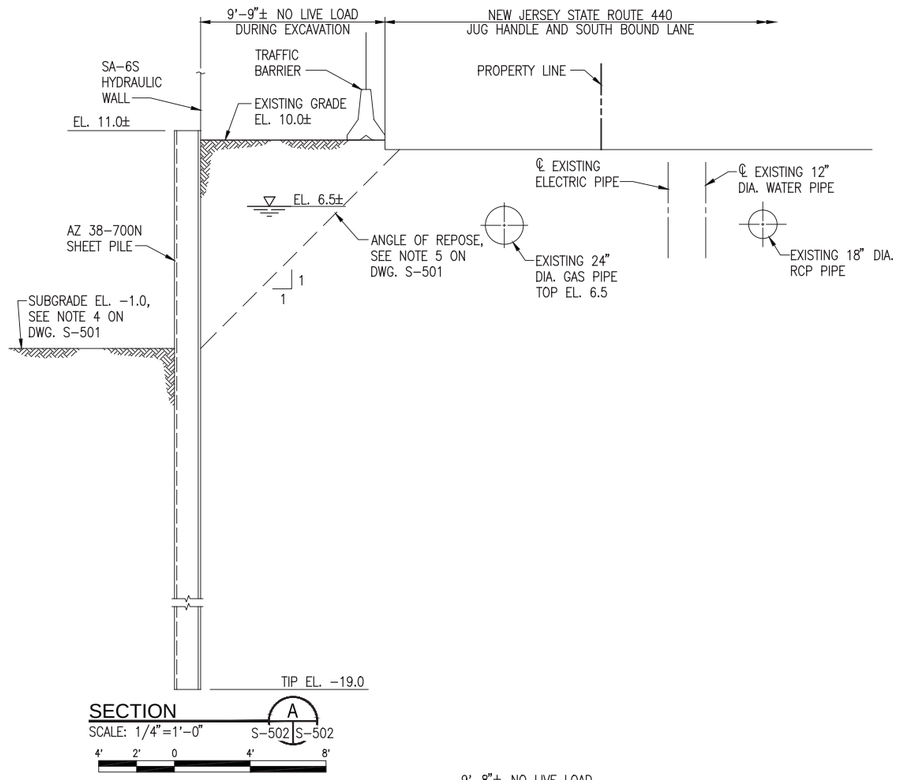


Exceedance:

- Water/Sewer utility Alert limit exceedance of 0.5in/s at 9:34am = 0.920 in/s (Longitude)
  Note: The limit was reach at the beginning phase when sheet was attempting to break through asphalt. Vibration levels were below threshold values after the initial break.

- Water/Sewer utility Alert limit exceedance of 0.5in/s at 10:20am = 0.575 in/s(Longitude)
  Note: Limiting level of vibration was reached as a result of the sheet being pushed down making contact with adjoining sheet, thereby amplifying the vibration levels.

Crack gauges:



There were no movements in crack gauges.

# Vibration Monitoring Report

## Study Area 6 South

**Prepared by**
**Geocomp Engineering**
**August 29, 2013**

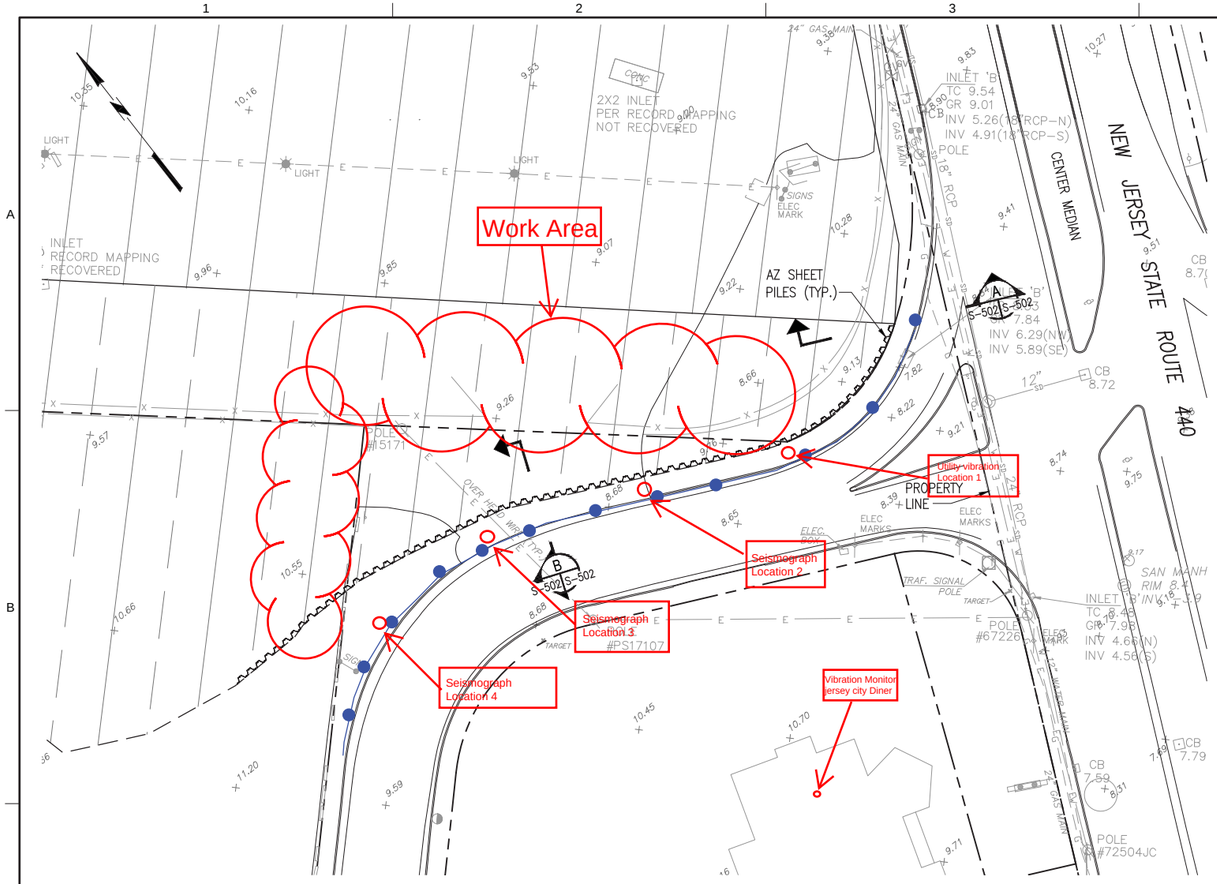
**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

**Summary of Work:**

The vibration work commenced at 7:30AM until 11:35AM and 12:50PM until 6:30PM. The seismograph was placed along the jug handle at total of 4 difference locations. The relocation times were at 9:22AM, 10:26AM and 11:35AM. There were a total of 2 exceedances recorded for the duration of the sheet driving activity.

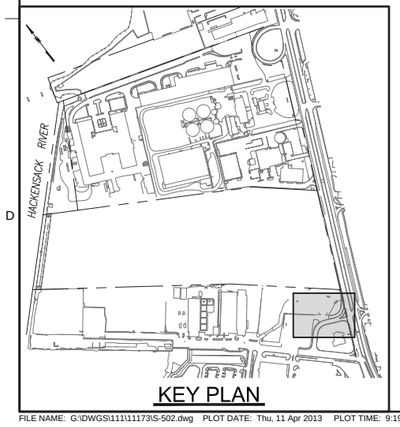


Exceedance:

- Water/Sewer utility Alert limit exceedance at 12:51PM of 0.55 in/s (Longitude)

- Water/Sewer utility threshold limit exceedance of 13:14am of 0.42 in/s(Longitude)

Crack gauges:



There were no movements in crack gauges.

# Vibration Monitoring Report

## Study Area 6 South

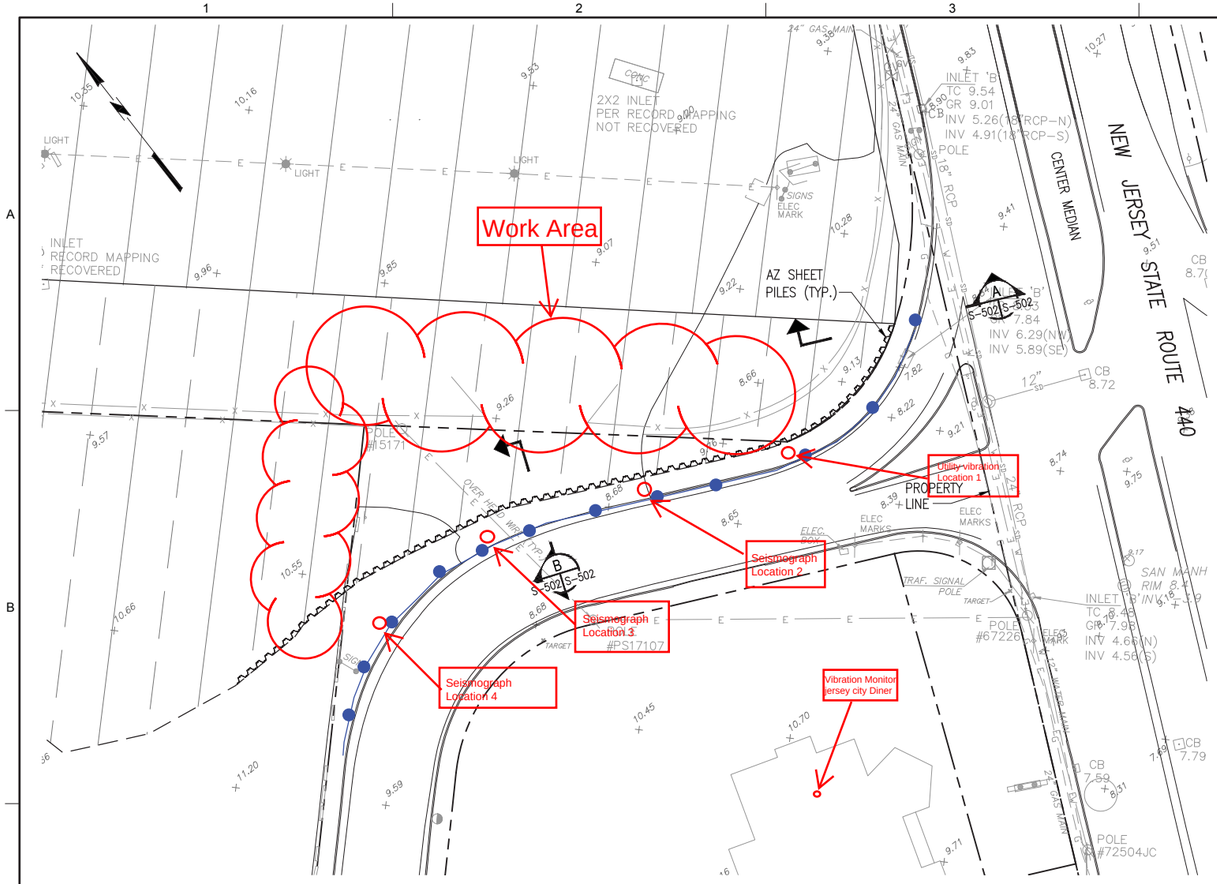
**Prepared by**
**Geocomp Engineering**
**August 30, 2013**

**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

**Summary of Work:**

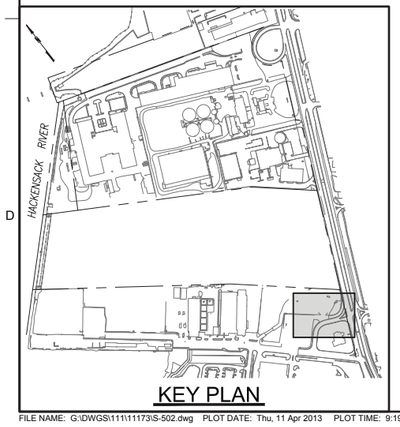


The vibration work commenced at 7:46AM until 10:30AM. The activities for the day were sheets driving down to required grade. The seismograph was placed along the jug handle at total of 4 difference locations. The relocation times were at 9:12AM, 9:43AM and 10:16AM. There were no exceedances recorded for the duration of the sheet driving activity.

Exceedance:

None

Crack gauges:



There were no movements in crack gauges.

# Vibration Monitoring Report

## Study Area 6 South

**Prepared by**
**Geocomp Engineering**
**October 3, 2013**

**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

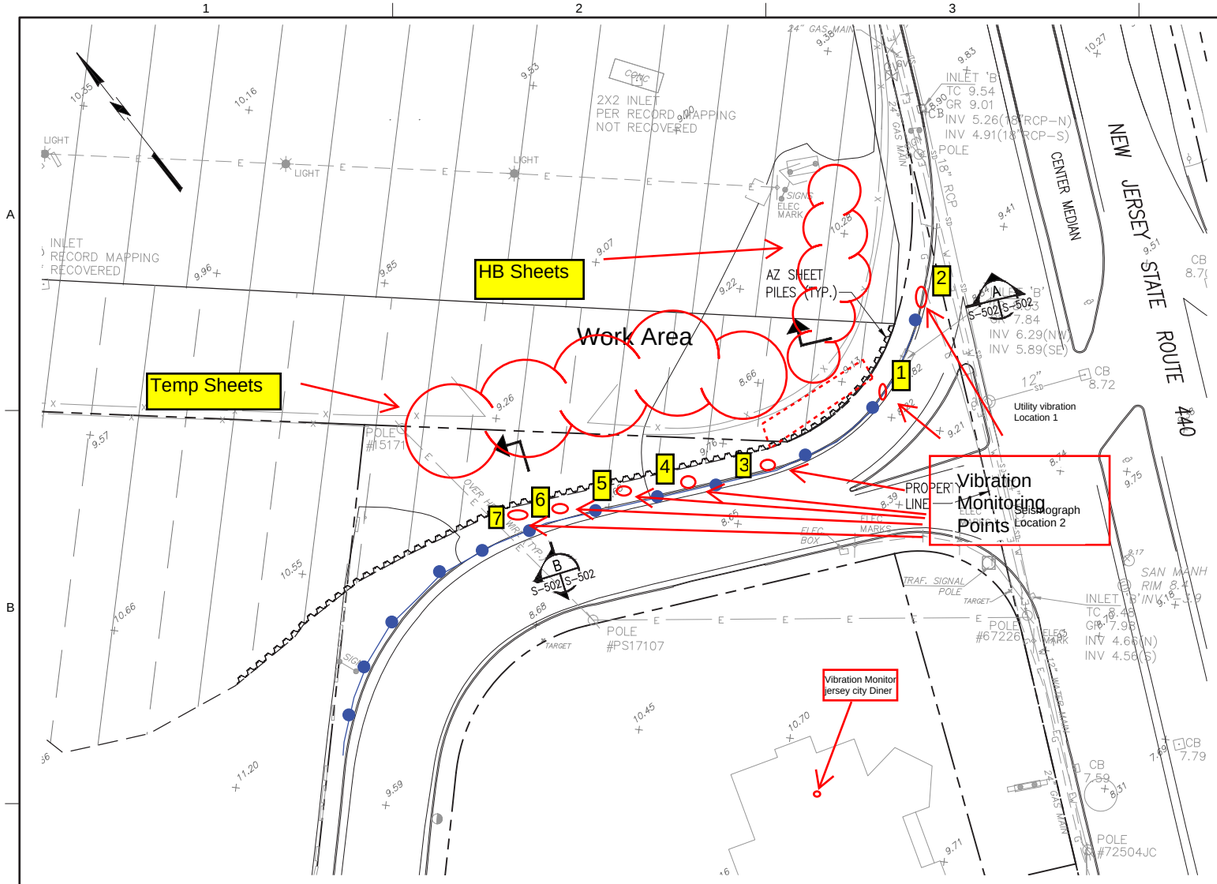
**Summary of Work:**
The vibration work commenced at 8:05 AM until 6:20 PM. The seismograph was placed along the jug handle at 7 locations. Location 1 and 2 were on top of the gas pipeline parallel to Rte. 440 along the sidewalk, and locations 3-7 were along the jug handle: see the site plan.

Exceedance (PPV >.5 in/s):

Force Main Alerts (in/s):

(Location 1)

8:16 AM: 0.59
9:09 AM: 1.25
9:39 AM: 0.81
9:43 AM: 1.01
9:52 AM: 1.30
9:55 AM: 1.39
10:09 AM: 0.82

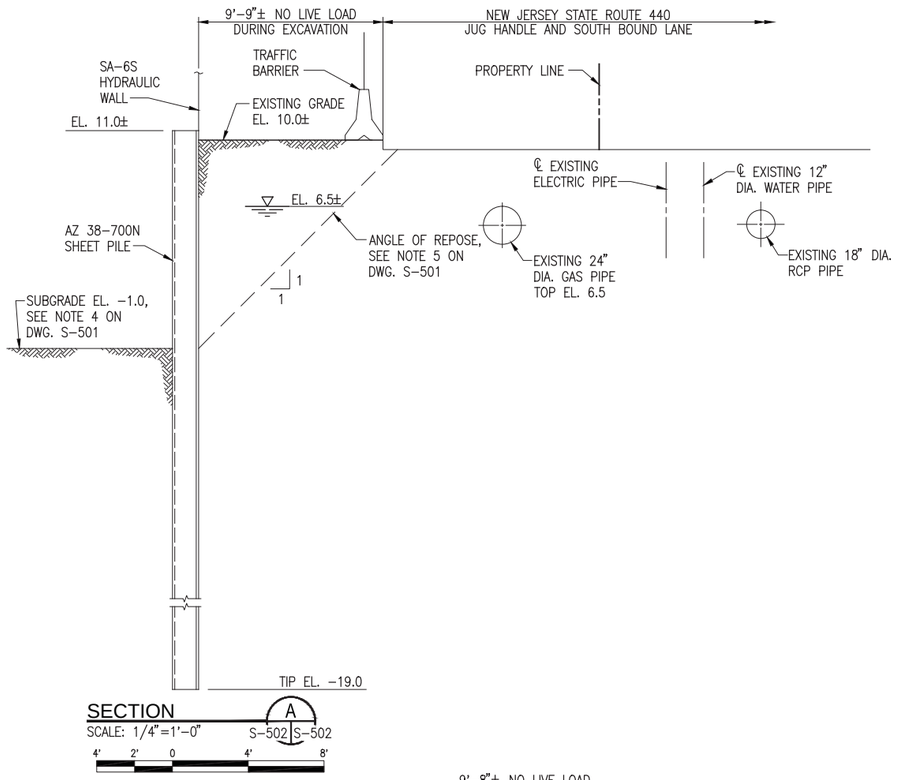


(Location 2)

10:52 AM: 0.51
10:56 AM: 0.79
11:06 AM: 0.96
11:17 AM: 1.13
11:24 AM: 0.63

Locations 3-7 had no limits due to not being in the proximity of the gas or force main line, but were monitored at the contractors request as work continued nearby. See attached Blastware reports for PPV's at these locations.

Crack gauges:



There were no movements in crack gauges.

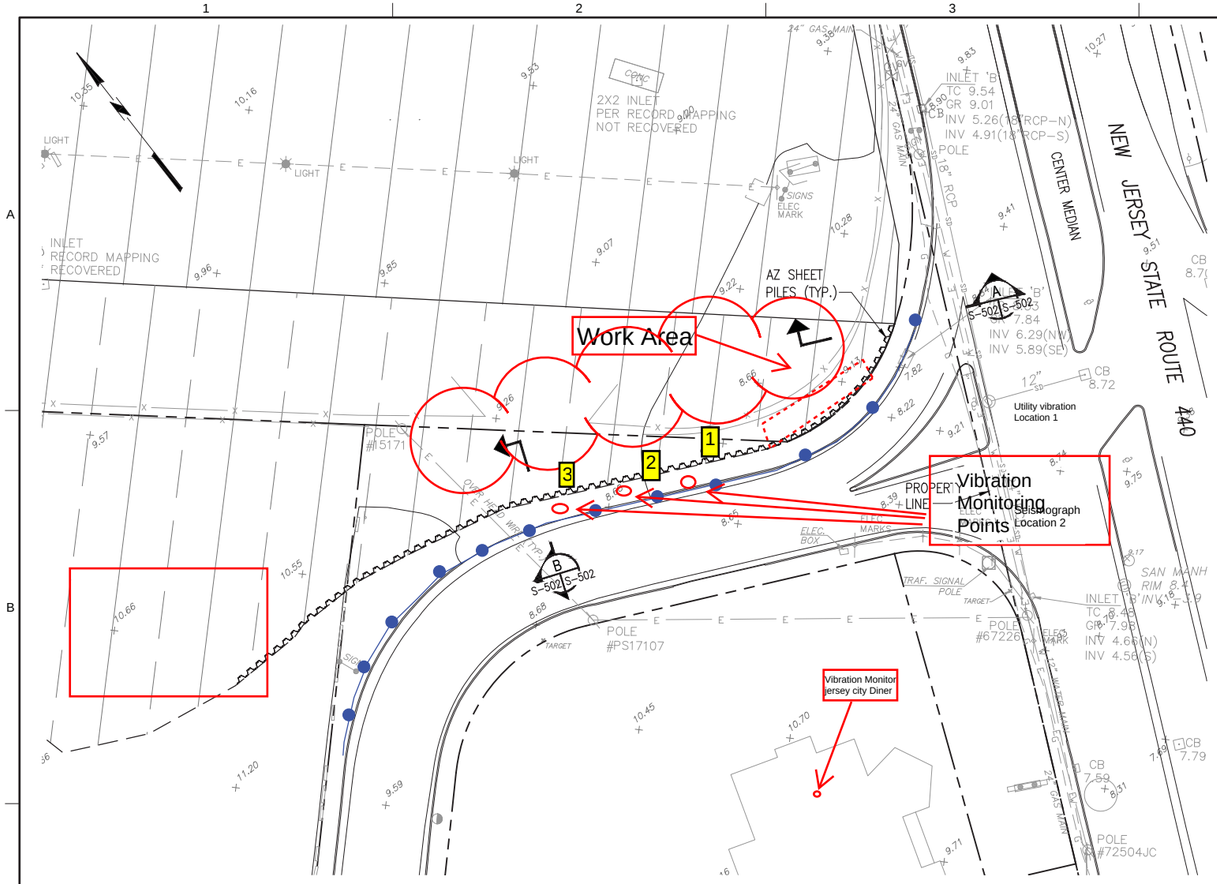
# Vibration Monitoring Report

## Study Area 6 South

**Prepared by**
**Geocomp Engineering**
**October 4, 2013**

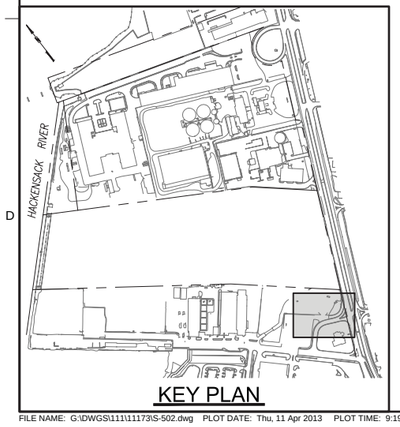


**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

**Summary of Work:**
The vibration work commenced at 7:45 AM until 5:00 PM. The seismograph was placed along the jug handle at 3 locations following the piledriving at the contractor's request, although there were no utilities in that area. See attached Blastware reports for PPV's at these locations.



Crack gauges:
There was no movement in the crack gauges.

# Vibration Monitoring Report

## Study Area 6 South

**Prepared by**
**Geocomp Engineering**
**October 18, 2013**

**For ENTACT, LLC**

139 Fulton St., Suite 917 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631

**NOTES:**

**Summary of Work:**

The vibration work, driving HB sheets, commenced at 8:30 AM and ran until 12:00 PM. The seismograph was placed along Route 440 at 8 locations. These ran parallel to the gas and water lines and were approximately 15-20 feet from where the work occurred. See below for exceedances.

Exceedance (PPV >.5 in/s):

Water line exceedances (in/s):

(Location 1)

9:19 AM: 0.53

(Location 2)

9:30 AM: 0.83
9:32 AM: 0.58

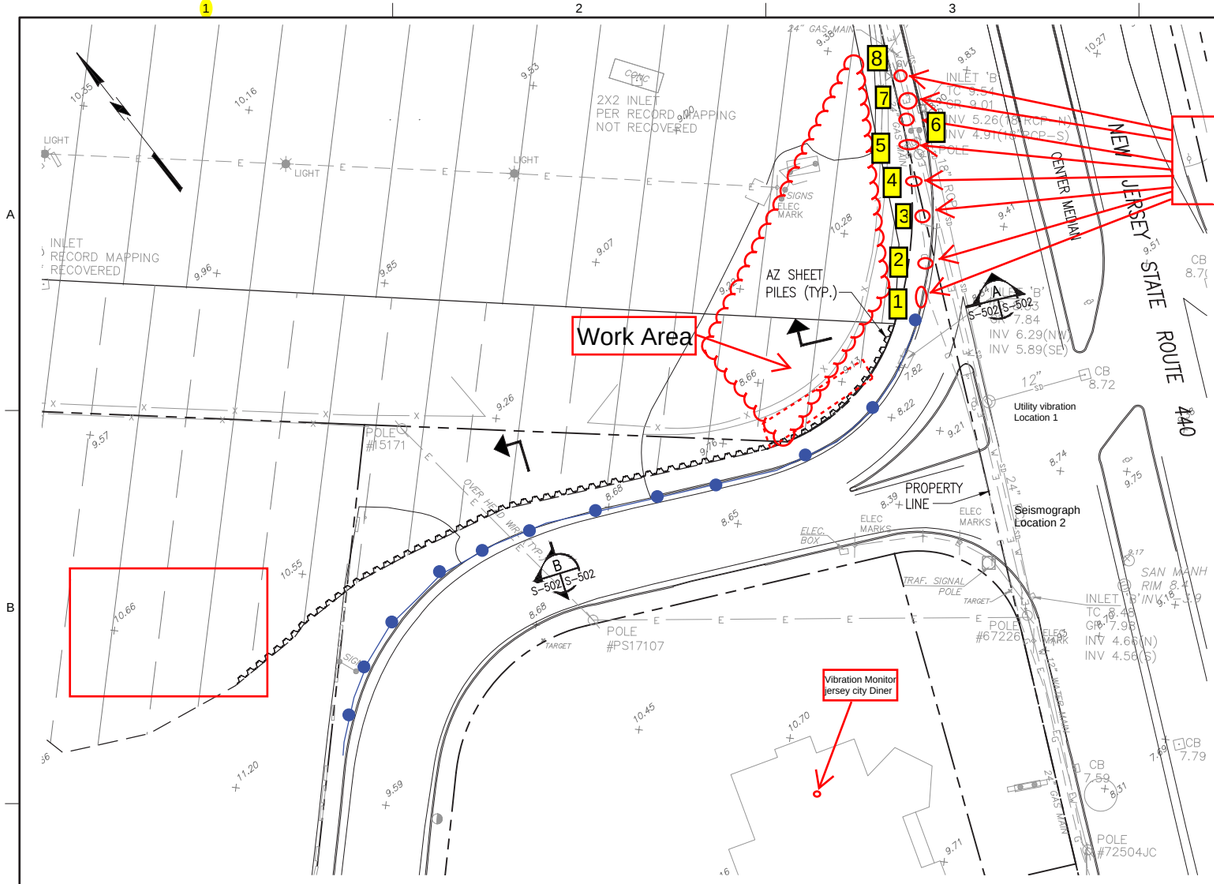
(Location 3)

9:48 AM: 1.16

(Location 5)

9:56 AM: 0.64

(Location 6)

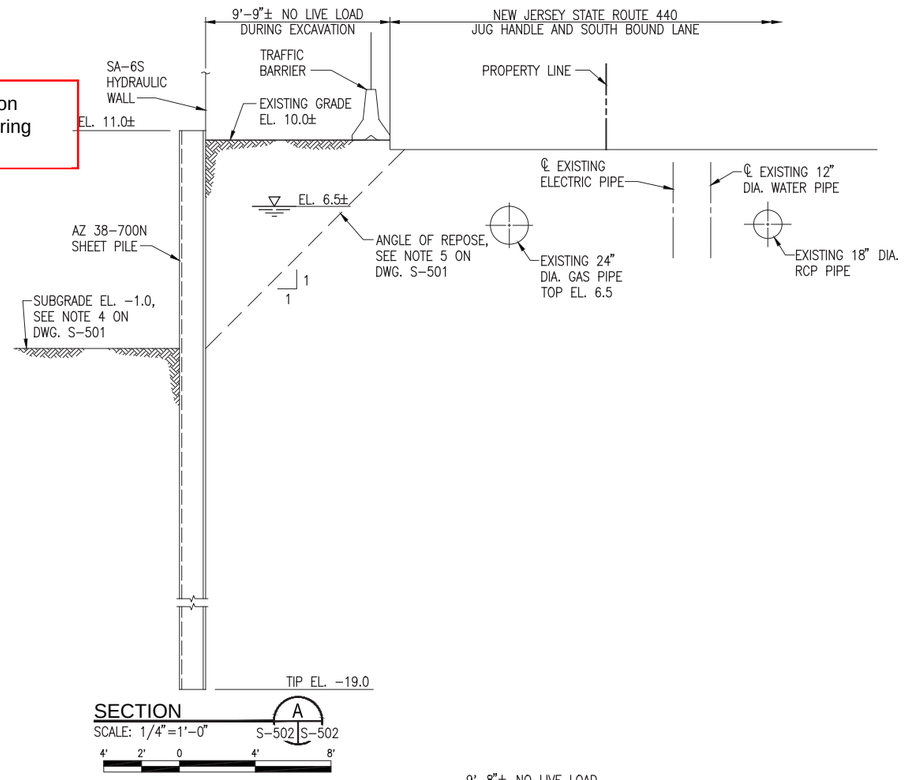


10:04 AM: 0.66

(Location 1)

11:40 AM: 0.51
11:41 AM: 1.25

Crack gauges:



There were no movements in crack gauges.

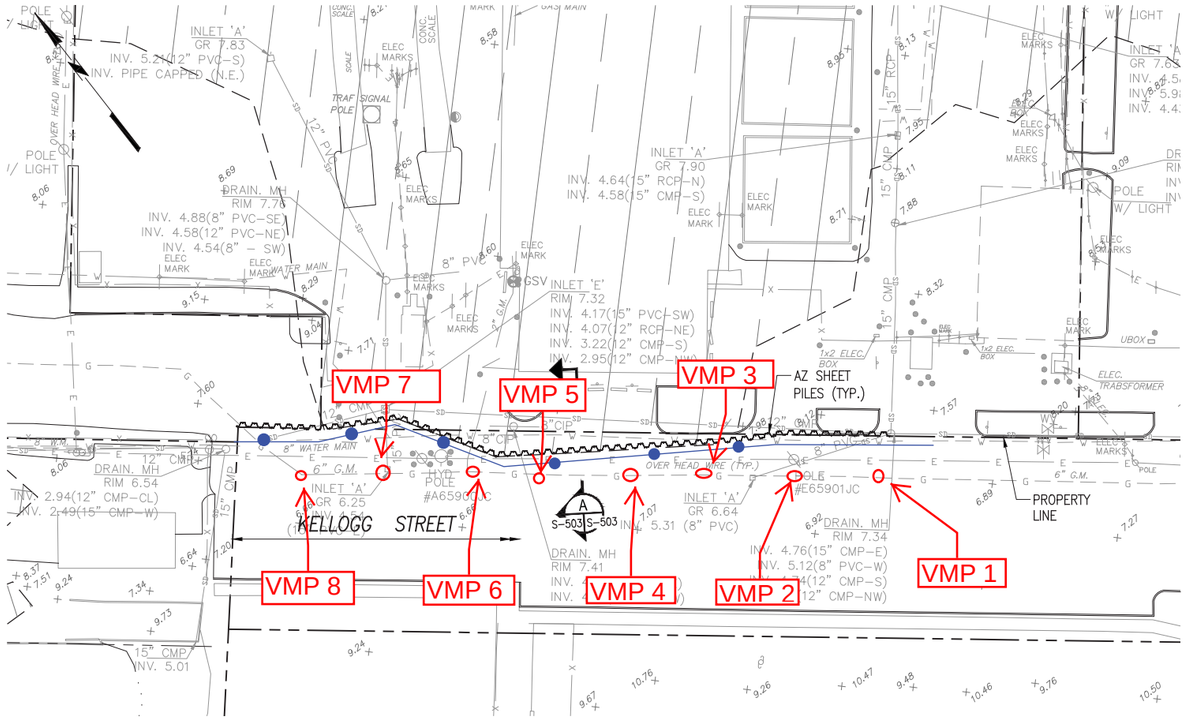
# Vibration Monitoring Report

## Study Area 6 South

**Prepared by**
**Geocomp Engineering**

**August 4th, 2014**
**For ENTACT, LLC**

111 John Street, Suite 650 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631



**NOTES:**

**Summary of Work:**
Sheet pile driving commenced at 8:10 AM and ended at 5:30 PM. An Instantel Blastmate III was used to record vibrations via a geophone placed on the ground over the 6 inch gas main, and an Instantel Minimate was used to record vibrations at 60 Kellogg Street in the part of the building closest to where work was being done. .

40 sheets were driven, and no exceedances were recorded. See attached plan for area of work and location of the seismographs. See attached Blastware reports for PPV at these locations.

6 Inch Gas Main:
Trigger Level: 1.0 in/sec
Alert Level: 2.0 in/sec

60 Kellogg Street:
Trigger Level: N/A
Alert Level: N/A

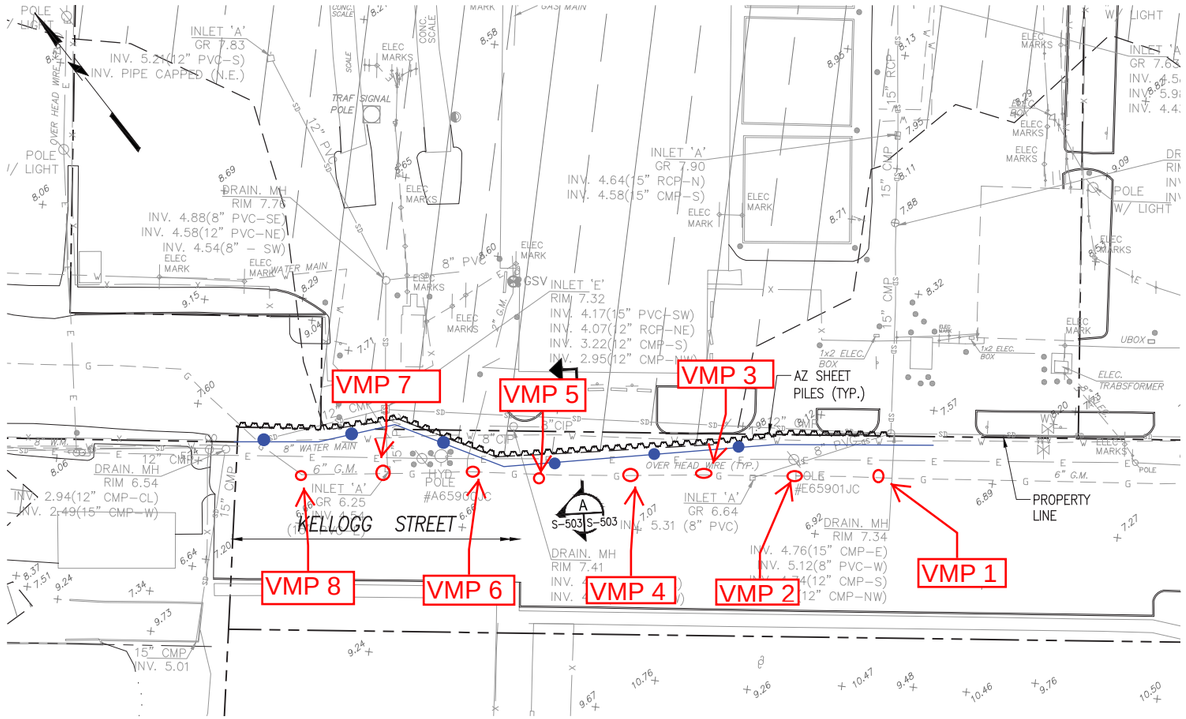
# Vibration Monitoring Report

## Study Area 6 South

**Prepared by**
**Geocomp Engineering**

**August 5th, 2014**
**For ENTACT, LLC**

111 John Street, Suite 650 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631



**NOTES:**

**Summary of Work:**
Sheet pile driving commenced at 11:20 AM and ended at 2:00 PM. An Instantel Blastmate III was used to record vibrations via a geophone placed on the ground over the 6 inch gas main, and an Instantel Minimate was used to record vibrations at 60 Kellogg Street in the part of the building closest to where work was being done. .

4 sheets were driven, then all 44 sheets were brought to grade, and no exceedances were recorded. See attached plan for area of work and location of the seismograph. See attached Blastware reports for PPV at these locations.

6 Inch Gas Main:
Trigger Level: 1.0 in/sec
Alert Level: 2.0 in/sec

60 Kellogg Street:

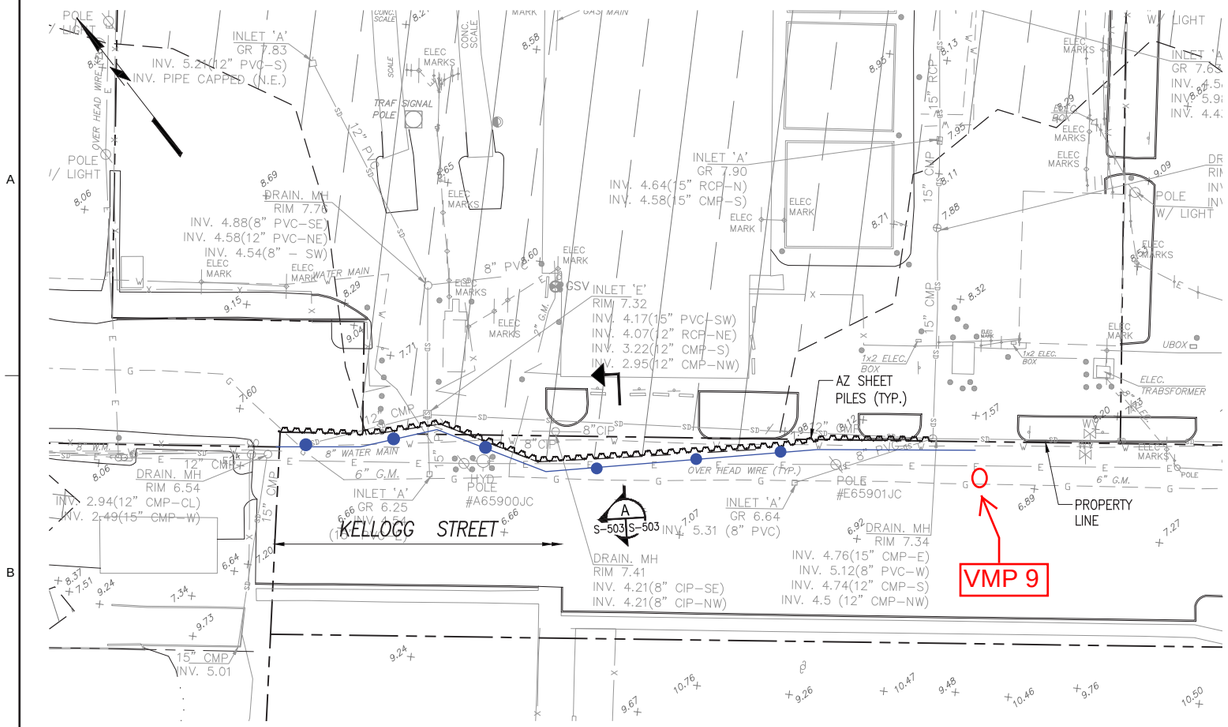
# Vibration Monitoring Report

## Study Area 6 South

**Prepared by**
**Geocomp Engineering**

**August 22nd, 2014**
**For ENTACT, LLC**

111 John Street, Suite 650 | New York, NY 10038 | Tel 212 566 6630 | Fax 212 566 6631



**NOTES:**

**Summary of Work:**
Sheet pile driving commenced at 7:40 AM and ended at 9:50 PM. An Instantel Blastmate III was used to record vibrations via a geophone placed on the ground over the 6 inch gas main, and an Instantel Minimate was used to record vibrations at 60 Kellogg Street in the part of the building closest to where work was being done.

8 sheets were driven, then all 8 sheets were brought to grade, and no exceedances were recorded. See attached plan for area of work and location of the seismograph. See attached Blastware reports for PPV at these locations.

Hamilton, New Jersey 08619

**APRIL 2016**

# INTRODUCTION

The surcharge monthly reports are generated to indicate the status of progress and/or indicate corrective actions needed as provided for in Appendix N (Surcharge Monitoring Plan, Section 5.0 Reporting). Report No. 13 July 2015 indicated completion of Area 1N, Area 2N, Area 1S, Area 2S and Area 3S.

Surcharge Instrumentation was installed in Area 3N and Area 4N subsequent to March 2015 in preparation for surcharge placement in those areas. Surcharge placement in Area 3N was complete on January 18, 2016. Surcharge placement in Area 4N was complete on January 29, 2016. This report is the third report for Area 3N and Area 4N. MRCE's March 29, 2016 letter confirms completion of Area 3N and Area 4N. This marks the formal end of the Surcharge Monitoring Program for the SA-6S and SA-6N project.

Report No. 16 will be the final report for the Surcharge Program.

The goal of the program was to "remove 100% of the Primary Consolidation that will result from the future development grading prior to cap installation". The reports have documented the successful attainment of that goal for each of the 7 designated areas. In general the magnitude of settlement and time for consolidation were consistent with the predicted settlements.

This report has been prepared consistent with the format and content of the prior reports with two notable exceptions.

1. Over the course of the program Installation Logs and instrument data plots were incorporated in one monthly report then incorporated by reference in subsequent reports. In this report a summary table is provided at the end of the Table of Contents that provides a matrix showing the report location for both monitoring data and installation logs by Area and Report Number.
2. All the MRCE approval letters have been included in the final report.

# REPORT CONTENTS

# 1.0 AREA 1N SUMMARY

Surcharging was initiated in Area 1N on April 8, 2014. Final surcharge placement was completed on July 31, 2014.

## 1.1 SURCHARGE MONITORING DATA TRENDS/ANOMALIES/ MODIFICATIONS

**Table 1N-1** below summarizes the status of the surcharge. Surcharging is complete at all 11 monitoring stations.

## 1.2 SURCHARGE PROGRESS

As noted in Section 1.1 and as summarized in **Table 1N-1** the surcharge objective has been met in the Stratum D at all 11 monitoring locations. Surcharge removal was initiated adjacent to the 72 in. force main on August 29, 2014 and continued through October.

Tasks requiring acoustical monitoring (Barrier Wall installation and Surcharge placement and removal) were completed by the end of October. Acoustical monitoring has been discontinued by PVSC.

**TABLE 1N-1**

# 2.0 AREA 2N SUMMARY

Geotechnical instrumentation has been installed in Surcharge Area 2N consistent with the Surcharge Monitoring Plan (Amec, 2013) and Design Change Bulletin dated April 30, 2014. The installed instrument locations are depicted on **Figure 2N-1** (attached). Geotechnical Boring Records and Instrument Construction Diagrams for Area 2N were previously provided in Report No. 4.

The Baseline Surcharge Settlement Analysis for 2N is shown in **Attachment 2N-1.**

Surcharge placement continued in Area 2N throughout October. The surcharge Placement was completed on November 3, 2014.

## 2.1 SURCHARGE MONITORING DATA TRENDS/ANOMALIES/ MODIFICATIONS

Monitoring is no longer being performed.

## 2.2 SURCHARGE PROGRESS

As of October 28, 2014 Amec Foster Wheeler Environment and Infrastructure's (Amec Foster Wheeler's) evaluation concluded that the surcharge objective has been met at all three locations. **Table 2N-1** below summarizes the status of the surcharge.

**TABLE 2N-1**
**SURCHARGE COMPLETION EVALUATION**
**SUMMARY OF EFFECTIVE STRESS**

| SURCHARGE MONITORING POINT | FINAL DEVELOPMENT CONDITION | SURCHARGE CONDITIONS | SURCHARGE COMPLETION EVALUATION | |
|---|---|---|---|---|
| | Middle of Stratum D | Middle of Stratum D | Middle of Stratum D Effective Stress Conditions / Comparisons | |
| | Effective Stress (psf) | Effective Stress (psf) | Percent Complete | Comments |
| **N_FS-05** | 2766 | 2970 | **107%** | Data as of November 2014; Pore pressure elevated 9.2 ft. (Stratum D). |
| **N_FS-06** | 2833 | 3497 | **123%** | Data as of November 2014 |
| **N_FS-07** | 2588 | 3389 | **131%** | Data as of November 2014 |

# 3.0 AREA 3N SUMMARY

Geotechnical instrumentation has been installed in Surcharge Area 3N consistent with the Surcharge Monitoring Plan (Amec, 2013) and Design Change Bulletin dated April 30, 2014. The installed instrument locations are depicted on **Figure 3N-1** (attached). Geotechnical Boring Records and Instrument Construction Diagrams for Area 3N were previously provided in Report No. 13.

The Baseline Surcharge Settlement Analysis for 3N is shown in **Attachment 3N-1.**

Surcharge placement commenced in November 2015 in Area 3N and was completed on January 18, 2016.

## 3.1 SURCHARGE MONITORING DATA TRENDS/ANOMALIES/ MODIFICATIONS

Copies of the data plots are provided in **Attachment 3N-2.** Final Surcharge Grades in Area 3N were 1-2 ft. above the Design Surcharge Grades. All instruments performed as expected. Pumping of the contingent groundwater collection system has allowed for the desired pore pressure dissipation to take place at all monitoring locations.

## 3.2 SURCHARGE PROGRESS

All eight monitoring stations have met the 100% primary consolidation goal and the areas where fill was last placed have also met the required surcharge completion criteria. The surcharge completion summary for Area 3N is included in **Table 3N-1**.

**TABLE 3N-1**
**SURCHARGE COMPLETION EVALUATION**

| **N_HS-12** | 1932 | 2198 | **114%** | SP and VWP data through 3/9/16. |
| **N_HS-13** | 2050 | 2214 | **108%** | SP and VWP data through 3/9/16. |

# 4.0 AREA 4N SUMMARY

Geotechnical instrumentation has been installed in Surcharge Area 4N consistent with the Surcharge Monitoring Plan (Amec, 2013) and Design Change Bulletin dated April 30, 2014. The installed instrument locations are depicted on **Figure 4N-1** (attached). Geotechnical Boring Records and Instrument Construction Diagrams for Area 4N were previously provided in Report No. 13.

The Baseline Surcharge Settlement Analysis for 4N is shown in **Attachment 4N-1.**

Surcharge placement was completed in Area 4N on January 29, 2016.

## 4.1 SURCHARGE MONITORING DATA TRENDS/ANOMALIES/ MODIFICATIONS

Data plots for Area 4N are included in **Attachment 4N-2.** All instrumentation performed as intended.

## 4.2 SURCHARGE PROGRESS

There are only two Full Stations in Area 4N. Both locations now have met the surcharge goal and are therefore considered complete. The areas that were loaded last have also been loaded for an adequate duration. The surcharge completion summary for Area 4N is included in **Table 4N-1**.

**TABLE 4N-1**
**SURCHARGE COMPLETION EVALUATION**
**SUMMARY OF EFFECTIVE STRESS**

| SURCHARGE MONITORING POINT | FINAL DEVELOPMENT CONDITION | SURCHARGE CONDITIONS | SURCHARGE COMPLETION EVALUATION | |
|---|---|---|---|---|
| | Middle of Stratum D | Middle of Stratum D | Middle of Stratum D<br>Effective Stress Conditions / Comparisons | |
| | Effective Stress (psf) | Effective Stress (psf) | Percent Complete | Comments |
| **N_FS-12** | 1869 | 1897 | **101%** | SP data through 3/9/16. VWP data through 3/24/16. |
| **N_FS-13** | 2064 | 2433 | **118%** | SP and VWP data through 3/9/16. |

# 5.0 AREA 1S SUMMARY

Geotechnical instrumentation has been installed in Surcharge Area 1S consistent with the Surcharge Monitoring Plan (Amec, 2013) and Design Change Bulletin dated April 30, 2014. The installed instrument locations are depicted on **Figure 1S-1** (attached). Geotechnical Boring Records and Instrument Construction Diagrams for Area 1S were included in Attachment 1S-3 Report No. 3.

The Baseline Surcharge Settlement Analysis for 1S is shown in **Attachment 1S-1.**

Surcharging was initiated in Area 1S on June 16, 2014 and continued through the week of September 26, 2014. Surcharging was noted as complete in Report No. 6, September 2014.

## 5.1 SURCHARGE MONITORING DATA TRENDS/ANOMALIES/ MODIFICATIONS

Monitoring is no longer being performed.

## 5.2 SURCHARGE PROGRESS

The Surcharge was considered complete (see **Table 1S-1**) at all locations as indicated in Report No. 6.

## 5.3 PROPOSED MODIFICATIONS

The grading of the surcharge pile has been modified at the Hackensack River to reduce load on the bulkhead and minimize the amount of rework in the deferred area. This information was issued in a Design Change Bulletin. The change moves the crest of the surcharge back approximately 16 ft. to the east.

**TABLE 1S-1**

# 6.0 AREA 2S SUMMARY

Geotechnical instrumentation has been installed in Surcharge Area 2S consistent with the Surcharge Monitoring Plan (Amec, 2013) and Design Change Bulletin dated April 30, 2014. The installed instrument locations are depicted on **Figure 2S-1** (attached). Geotechnical Boring Records and Instrument Construction Diagrams for Area 2S were previously provided in Attachment 2S-2 of Report No. 4.

The Baseline Surcharge Settlement Analysis for 2S is shown in **Attachment 2S-1.**

Surcharging was initiated in Area 2S in July 2014 as subgrade fill placement progressing from Area 1S into Area 2S. Placement of subgrade fill was completed during the December reporting period. The placement of "Celgene and Novartis" imported fill was completed in the January reporting period.

Surcharging for Area 2S was noted as complete in Report No. 10.

## 6.1 SURCHARGE MONITORING DATA TRENDS/ANOMALIES/ MODIFICATIONS

Surcharge monitoring is no longer being conducted in Area 2S.

## 6.2 SURCHARGE PROGRESS

As of January 26, 2015 the reduced data at all 10 monitoring stations indicated that the completion criteria has been met. **Table 2S-1** below summarizes the status of the surcharge at each monitoring stations at the end of the January monitoring period.

## 6.3 PROPOSED MODIFICATIONS

There have been no modifications to the Surcharge Plan in Area 2S.

**TABLE 2S-1**
**SURCHARGE COMPLETION EVALUATION**
**AMEC CORRECTED RESULTS JANUARY 2015**

# 7.0 AREA 3S SUMMARY

Geotechnical instrumentation has been installed in Surcharge Area 3S consistent with the Surcharge Monitoring Plan (Amec, 2013) and Design Change Bulletin dated April 30, 2014. The installed instrument locations are depicted on **Figure 3S-1** (attached). Geotechnical Boring Records and Instrument Construction Diagrams for Area 3S were previously provided in Attachment 3S-1 of Report No. 1.

The Baseline Surcharge Settlement Analysis for 3S is shown in **Attachment 3S-1.**

Surcharging was initiated in Area 3S in November 2014 as subgrade fill placement progressing from West to East. Completion of surcharge fill placement finished in the first week of March with the placement of a small volume of gravel surface at the east end of Area 3S.

## 7.1 SURCHARGE MONITORING DATA TRENDS/ANOMALIES/ MODIFICATIONS

Surcharge monitoring is no longer being conducted.

## 7.2 SURCHARGE PROGRESS

As of the close of the March, 2015 reporting period Amec Foster Wheeler's evaluation concludes that the surcharge objective has been met at all nine locations. **Table 3S-1,** below, summarizes the status of the surcharge.

MRCE have completed their peer review of the results. MRCE's letter dated April 24, 2015 (Attachment 3S-4 to Report No. 10) indicates that based on their analysis all stations met the surcharge program completion goal as of the end of the March 2015 reporting period.

## 7.3 PROPOSED MODIFICATIONS

The 0-12 ft. wide Deferred Area strip along Route 440 will not be surcharged. The surcharge design grades have been carried to the point of forming a stable slope at the Barrier Wall at elevation 11. A Design Change Bulletin has been filed documenting this Field Change. The development grades are similar to the existing grades along the "Deferred Area" (i.e. approximately + 0.5 ft.). The surcharge height

in this area was an artifact resulting from generating a simple surcharge pile geometry with a uniform slope. Therefore elimination of surcharge from this strip will have no impact on the Chromium Remedy.

The intent of SP-08 was to monitor settlement impacts on the perimeter pool. The original Settlement Platform SP-08 was located just south of the SA-7 barrier wall and not north of the wall over the perimeter pool. The platform was relocated mid-January 2015 to be over the perimeter pool. The platform was renamed SP-08 (2). Both plots are included in this report.

Re: SA-6 North Surcharge Monitoring
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

Mueser Rutledge Consulting Engineers (MRCE) reviewed the settlement and piezometer monitoring data related to Area 1N provided by AMEC, on July 18th 2014. MRCE's review of the available data is summarized below:

1. AMEC indicated boring sampling performed was to define the compressible layer stratification and the Vibrating Wire Piezometers (VWP) were set at the center of the layers. Center of the layer provide the most conservative pore water pressure reading for the effective stress evaluation. MRCE effective stress calculations were made at the center of the layers.

2. MRCE obtained the 06/16/14 measured fill thickness from the "Settlement Platform – Data Report". MRCE calculated the total stress as of 06/16/14 based on the 06/16/14 fill thickness and the "Historic Pre-Construction Conditions" total stresses provided by AMEC. MRCE calculated the pore water pressures based from 06/16/14 piezometer readings on "Vibrating Wire Piezometer – Data Report" and calculated the 06/16/14 effective stresses, as presented in Table 1.

3. MRCE compared calculated 06/16/14 effective stresses with the effective stresses provided by AMEC for "Final Post-Development Conditions". The defined goal of surcharge program was to achieve an equal or greater effective stress than the "Final Post-Development Conditions" effective stress. Accordingly, MRCE evaluated 06/16/14 percentage completion, shown as "MRCE % Completion (06/16/14)" in Table 1. Table 1 also presents 06/30/14 percent completion evaluation of AMEC, "AMEC % Completion (06/30/14)", for comparison.

4. Two settlement monitoring locations, N_FS-04 and N_HS-04 (highlighted in Table 1), had percentage completion less than 100%. These monitoring points did not meet the defined goal of the surcharge program as of 06/16/14.

5. AMEC provided updated settlement and piezometer monitoring data on August 6th 2014. MRCE calculated effective stresses and the percent completion for N_FS-04 and N_HS-04 based on the updated monitoring data, as shown in Table 2.

6. MRCE agrees that the defined goal of the surcharge program of achieving an equal or greater effective stress than the "Final Post-Development Conditions" effective stress is met in all settlement monitoring locations.

Very truly yours,

Attention: Mr. Geoff Shallard

Re: Area 2N Surcharge Review
SA-6 North
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of November 17, 2014 AMEC settlement and piezometer monitoring data for Area 2N is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used measured fill thickness dated 10/28/14 from "Settlement Platform – Data Report" to calculate the total stress. Pore water was taken from the 10/28/14 "Vibrating Wire Piezometer – Data Report." Effective stress computed for 10/28/14, is presented in Table 1. MRCE compared the 10/28/14 calculated effective stress with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 2N monitoring locations have met the surcharge program goal as of 10/28/14.

Very truly yours,
**MUESER RUTLEDGE CONSULTING ENGINEERS**

Attn: Mr. Geoff Shallard

Re: Updated Area 3N and 4N Surcharge Review
SA-6 North
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of March 15th, 2016 AMEC settlement and piezometer monitoring data for Area 3N and 4N is summarized below:

AMEC indicated boring sampling was performed to define the soil profile and the Vibrating Wire Piezometer (VWP) was set at the center of the compressible layer, so that the pore water pressure reading is the most conservative for effective stress evaluation. All the effective stress calculations were made at the center of the layers.

MRCE used the latest measured elevation head dated March 15th, 2016 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated using fill thickness measurements from the "Settlement Platform – Data Report" taken on March 9th, 2016. Calculated post-surcharge effective stresses are presented in Table 1 and Table 2. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of the surcharge program was to achieve an effective stress greater than "Final Post-Development Conditions."

This review finds that with the March 15, 2016 readings all settlement monitoring locations, including the two settlement locations, N_HS-11 in Area 3N (Table 1) and N_FS-12 in Area 4N (Table 2), have met the surcharge program goal. This finding is in agreement with the AMEC data review and interpretation.

Very truly yours,

Attn: Mr. Geoff Shallard

Re: Updated Area 3N and 4N Surcharge Review
SA-6 North
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of March 15th, 2016 AMEC settlement and piezometer monitoring data for Area 3N and 4N is summarized below:

AMEC indicated boring sampling was performed to define the soil profile and the Vibrating Wire Piezometer (VWP) was set at the center of the compressible layer, so that the pore water pressure reading is the most conservative for effective stress evaluation. All the effective stress calculations were made at the center of the layers.

MRCE used the latest measured elevation head dated March 15th, 2016 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated using fill thickness measurements from the "Settlement Platform – Data Report" taken on March 9th, 2016. Calculated post-surcharge effective stresses are presented in Table 1 and Table 2. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of the surcharge program was to achieve an effective stress greater than "Final Post-Development Conditions."

This review finds that with the March 15, 2016 readings all settlement monitoring locations, including the two settlement locations, N_HS-11 in Area 3N (Table 1) and N_FS-12 in Area 4N (Table 2), have met the surcharge program goal. This finding is in agreement with the AMEC data review and interpretation.

Very truly yours,

Re: SA-6 ~~North~~ Surcharge Monitoring
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

Mueser Rutledge Consulting Engineers (MRCE) reviewed the settlement and piezometer monitoring data related to Area 1S provided by AMEC, on October 17th 2014. MRCE's review of the available data is summarized below:

1. AMEC indicated boring sampling were performed and the Vibrating Wire Piezometer (VWP) was set at the center of the layer. Center of the layer provide the most conservative pore water pressure reading for the effective stress evaluation. All the effective stress calculations were made at the center of the layers.

2. MRCE used measured fill thickness dated 09/22/14 from provided "Settlement Platform – Data Report" and calculated the total stress as of 09/22/14 based on the fill thickness recorded on 09/22/14 and the "Historic Pre-Construction Conditions" total stresses provided by AMEC. MRCE evaluated the pore water pressures based on the piezometer reading on 09/23/14 from "Vibrating Wire Piezometer – Data Report" and calculated the effective stresses as of 09/23/14, as presented in Table 1.

3. MRCE compared calculated effective stresses of 09/23/14 with the effective stresses provided by AMEC for "Final Post-Development Conditions". The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions" effective stress. Percent completion computed by MRCE ("MRCE % Completion (09/23/14)" in Table 1) indicates effective stress compared to "Final Post-Development Conditions" effective stress; percent completion greater than 100 % indicates overconsolidation compared to "Final Post-Development Conditions" effective stress. Table 1 also presents percent completion evaluation of AMEC as of 09/26/14, "AMEC % Completion (09/26/14)" for comparison.

4. Settlement monitoring location S_FS-02 (highlighted in attached Table 1) has not yet met the surcharge program goal as of 09/23/14.

5. MRCE suggests leaving the surcharge on at S_FS-02 location until the pore water pressure dissipate such that the pore pressure head measured in the middle of Stratum D drops an additional 1.5 ft, or raising grade to increase the total stress to accelerate consolidation.

Very truly yours,

**MUESER RUTLEDGE CONSULTING ENGINEERS**

Attention: Mr. Geoff Shallard

Re: Area 2S Surcharge Review
SA-6 North
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of February 06, 2015 AMEC settlement and piezometer monitoring data for Area 2S is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated between January 12-29, 2015 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken at corresponding dates, between January 14-30, 2015. Calculated post-surcharge effective stresses are presented in Table 1. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 2S monitoring locations have met the surcharge program goal as of 01/30/2015.

Very truly yours,
**MUESER RUTLEDGE CONSULTING ENGINEERS**

Attention: Mr. Geoff Shallard

Re: Area 3S Surcharge Review
SA-6 South
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of March 30, 2015 AMEC settlement and piezometer monitoring data for Area 3S is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated between March 24-13, 2015 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken on March 19, 2015. Calculated post-surcharge effective stresses are presented in Table 1. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 3S monitoring locations have met the surcharge program goal as of 03/30/2015.

Very truly yours,

**MUESER RUTLEDGE CONSULTING ENGINEERS**

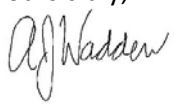
Amec Foster Wheeler E&I, Inc.
200 American Metro Boulevard
Hamilton, New Jersey 08619

Attention: Eric Christodoulatos



Reference: Settlement Platform Decommissioning
Honeywell Site, Jersey City, New Jersey

Dear Eric,

B&B Drilling, Inc. (B&B) decommissioned settlement platforms at the north and south surcharge areas. Although settlement platforms were not NJDEP-permitted wells they were decommissioned in accordance with the NJDEP regulations for well abandonment (N.J.A.C. 7:9D-3.1). The only difference is that no formal decommissioning report submission to NJDEP was required.

Settlement platforms were constructed with a 1-inch galvanized steel casing inside a 4-inch PVC casing. A portion of the annular space between the 1 and 4-inch pipes was filled with bentonite when originally constructed. The decommissioning consisted of pressure tremie grouting both the 1-inch inner casing and the remaining open annular space in the 4-inch casings at each settlement platform.

Yours truly,

Andrew Wadden
Operations Manager

# WELL PERMIT

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | PLEASE SEE ATTACHED |
| Unusual Conditions: | PLEASE SEE ATTACHED |
| Reason for Deviation: | PLEASE SEE ATTACHED |
| Proposed Well Construction | PLEASE SEE ATTACHED |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | Please see attachments. |
| Unusual Conditions: | Please see attachments. |
| Reason for Deviation: | Please see attachments. |
| Proposed Well Construction | Please see attachments. |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | Please see attached Engineer's Design Documentation. |
| Unusual Conditions: | Please see attached Engineer's Design Documentation. |
| Reason for Deviation: | Please see attached Engineer's Design Documentation. |
| Proposed Well Construction | Please see attached Engineer's Design Documentation. |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

## LIST OF ACRONYMS

AO – Add-On
AOC – Area of Concern
BO – Burnout
CF – Custom Fit Repairs
CQA – Construction Quality Assurance
DCB – Design Change Bulletin
DO – Damage By Others
DS – Destruct Sample (Fusion)
DSX – Destruct Sample (Extrusion)
EOR – Engineer of Record
FS – Failed Seam
GCL – Geosynthetic Clay Liner
GDL – Geocomposite Drainage Layer
GVL – Geocomposite Venting Layer
HB – Hydraulic Barrier
IFC – Issued for Construction
LF – Linear Feet
LLDPE – Linear Low-Density Polyethylene
PB – Pipe Boot
PSI – Pounds per Square Inch
RCRA – Resource Conservation & Recovery Act
RFI – Request for Information
RAR – Remedial Action Report
RIR – Receiving Inspection Report
RP - Repair
RW – Roller Wrinkle
SA-6 – Study Area 6
SCB – Soil Cement Bentonite
SI – Subgrade Irregularity
SJ – Seam Joint
QA - Quality Assurance
QA Report – Cap Geosynthetic Quality Assurance Report
QC – Quality Control
WR - Wrinkle

## 1.0 INTRODUCTION

The purpose of this Cap Geosynthetic Quality Assurance Report (QA Report) is to present the observations made, and data collected during the construction of an engineered cap placed within the Study Area 6 (SA-6) South Open Space Area of Concern (AOC) located in Jersey City, New Jersey (Site). The capping activities at SA-6 South included the preparation of the soil subgrade, placement of geocomposite venting layer (GVL), geosynthetic clay liner (GCL), linear low-density polyethylene (LLDPE) geomembrane, and a geocomposite drainage layer (GDL). Langan Engineering & Environmental Services, Inc. (Langan) was contracted by Honeywell International, Inc. (Honeywell) to provide independent Quality Assurance (QA) for the installation of the geosynthetic components of the cap.

The Chromium Remedy *100% Design* Issued for Construction dated June 2013, (*100% Design*) was prepared by AMEC Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) on behalf of Honeywell, to address chromium contamination at SA-6 South. The *100% Design* required installation of a Resource Conservation and Recovery Act (RCRA) – equivalent geosynthetic cap system, including a venting layer for naturally occurring methane, covering approximately eight acres of the designated Open Space AOC. As part of this QA Report, the Record Drawings, which outline the placement and construction of the various geosynthetic components of the cap, have been provided as *Appendix A*. Other design details discussed herein, including the Issued for Construction (IFC) drawings, geosynthetics specifications, and geosynthetic products approved for this site are incorporated by reference only. Refer to Amec Foster Wheeler documents titled "*100% Design*," dated June 2013, and "*Remedial Action Report (RAR) for Chromium*" for these details.

This QA Report documents the results of the QA Geosynthetic activities conducted during the construction of the cap at SA-6 South by both Langan and Amec Foster Wheeler field personnel. Refer to the Construction Quality Assurance (CQA) Plan prepared by Langan in June 2015 (attached as *Appendix B*) for a description of the scope conducted by Langan, as well as the roles and responsibilities of the owner, Engineer of Record (EOR), earthwork contractor, and liner contractor. Design Change Bulletins (DCBs) and Requests for Information (RFIs) which were generated subsequent to the *100% Design*, and relevant to the QA scope were reviewed and approved by the EOR, and are further summarized in the EOR Closure Report.

This QA Report specifically includes the following documentation of the cap construction activities:

- The Record Drawings;
- Summary of the various phases of the work observed as part of this QA Report;
- Daily Reports indicating the work activities completed each day and other pertinent information;
- Daily cap construction forms submitted by the Geosynthetic Installer which includes: Repair Reports, Trial Weld Logs, Panel Placement Forms, Seam Control Forms, Destructive & Non-Destructive Test Forms, and Subgrade Approval Forms;
- Field testing results for fusion welds and extrusion welds;
- Laboratory testing results for the destructive samples collected (i.e., fusion & extrusion welds);

- Photographs depicting daily work activities and the various phases of the capping activities; and
- Independent QA's certification that the placement of the SA-6 South geosynthetics was implemented in general compliance with the design documents.

This QA Report addresses the cap construction of SA-6 South only. The cap construction at SA-6 North is proposed to commence in the spring of 2016 and will be addressed in a separate QA Report (to be provided upon completion of the SA-6 North cap).

## 2.0 SA-6 SOUTH CAP CONSTRUCTION AND DOCUMENTATION

### 2.1 General

This Section describes the construction methods used and the Quality Control (QC) and QA documentation completed as part of the construction of SA-6 South. This Section also provides the results of the QC and QA testing that was performed during field activities by Langan (QA Engineer), Environmental Specialties International (ESI) as the Geosynthetic Installer, and Entact, LLC (Entact) as the Construction Contractor and QC.

QA activities commenced on July 7, 2015, with Langan conducting observation of the soil subgrade preparation for the western end of SA-6 South (near the Hackensack River). Geocomposite / geotextile placement began on July 20, 2015 and continued until capping activities were completed by November 4, 2015. Relevant observations and QA/QC testing during this timeframe are defined further in this section. A project Certificate of Completion (completed and verified by Entact) certifying that the SA-6 South cap has been constructed and completed in compliance with the project drawings and technical specifications is attached as *Appendix C*.

### 2.2 Survey Control / Subgrade Elevations

Entact subcontracted Maser Consulting, P.A. (Maser), a licensed New Jersey land surveyor, who provided surveying services during the construction of the cap. Maser completed surveying of the cap from the initial subgrade preparation phases to the placement of the geomembrane. Maser surveyed the subgrade elevations of the cap prior to material placement and tabulated the survey results as compared to the design elevations on the construction control grid. These survey activities included:

1. Measurement of elevations of the subgrade surface in accordance with a pre-determined Construction Control Grid. Conformance to the design lines and grades was verified by Amec Foster Wheeler and Entact by comparing the actual elevations with the design elevations on the Construction Control Grid. The accepted subgrade elevations, and corresponding Construction Control Grid for SA-6 South are provided within *Appendix D1* and *Appendix D2*, respectively.
2. Measurement of the as-built conditions including the perimeter or termination of the geomembrane and geotextile over the hydraulic barrier (HB), and Soil Cement Bentonite

(SCB) wall, as well as, the location of the geomembrane repairs, boots / penetrations, and other pertinent information related to the construction of the cap.

3. The subgrade surface was observed to verify uniformity of grade between the construction control grid points.

This survey information is shown on the final Record Drawings attached in *Appendix A.* Amec Foster Wheeler provided QA review and verification of the Maser survey data.

## 2.3 Soil Subgrade Preparation

Soil subgrade preparation was required prior to the placement of the geotextile and the geomembrane in the areas to be capped. Soil subgrade preparation for the cap was completed by Entact using the following procedures:

- Step 1: Entact conducted rough grading of the subgrade surfaces with the use of track-mounted dozers to prepare the appropriate grades and to clear the surface of large objects (i.e. rocks, metals, debris, etc.);
- Step 2: The subgrade surface was fine-graded and compacted in accordance with the project specifications presented in the *100% Design* package. Subgrade sections not meeting survey or compaction requirements were re-worked by Entact until specified conditions were achieved. At the conclusion of this step, Entact provided a certification that the surface met the grading and compaction requirements. The certifications included the Construction Control Grid tabulation prepared by Maser (as defined in *Section 2.2*) and issuance of a Certificate of Subgrade Surface Acceptance as defined in further detail below;
- Step 3: When precipitation was forecast, the prepared subgrade surface was temporarily covered with a polyethylene plastic sheet to protect the soil from overnight precipitation; and
- Step 4: The subgrade surface would be uncovered in approximate 100 ft. sections (moving from west to east across SA-6), followed by extra fine grading conducted by laborers who cleared the surface of extraneous materials greater than ½-inch in diameter, followed by repair and re-compaction of any areas that became inadvertently wetted.

Entact and ESI also conducted their own observation of the subgrade surface to confirm if the surface was acceptable for the placement of the geosynthetic material. Upon notification by Entact that the grading was acceptable, Langan conducted an independent observation to identify that the subgrade was prepared in general accordance with the *100% Design*.

If the soil subgrade surface was deemed acceptable with no additional re-work required, the Langan QA and Entact QC representative signed and submitted an acceptance form for the approved subgrade. The daily QA subgrade approval forms are provided in *Appendix E*, with the ESI Certificate of Subgrade Surface Acceptance forms provided in *Appendix E1*, and the Langan Certificate of Soil Surface provided in *Appendix E2.* In the event the subgrade surface was not

deemed acceptable, Steps 2, 3, and 4 outlined above were repeated until an acceptable subgrade surface was achieved (based on conditions outlined in the Langan Certificate of Soil Surface forms) and confirmed by Langan and Entact.

*Figure 1* below shows a typical section of subgrade approved for geomembrane placement. Additional photos and summaries of the subgrade preparation activities conducted each day are presented in the Daily Reports and Daily Photo Logs provided in *Appendix F.*

**Figure 1 – Typical Soil Subgrade Approved for Geomembrane Placement**

## 2.4 SA-6 South Cap Components

### *2.4.1 Geotextiles*

After approval of various sections of the subgrade surface, a 16 oz. geotextile layer was placed over the HB and SCB barrier walls around the perimeter of the capped area. According to the *100% Design* package, this geotextile layer was designed to protect the 60-mil LLDPE geomembrane from potential puncture damage from the perimeter barriers / walls. The approved 16 oz. non-woven geotextile fabric layer (i.e., defined as SKAPS GE-116 in Amec Foster Wheeler's *EOR Closure Report*) was delivered to the project site, offloaded, and staged onsite by Entact. For each delivery, Amec Foster Wheeler prepared a Receiving Inspection Report (RIR) to document receipt of acceptable materials. The RIRs outlining the date, material, quantity, and other pertinent details of the geotextile rolls delivered to the Site are provided in *Appendix G*.

The 16 oz. geotextile was installed by ESI at locations shown on the Record Drawings. Geotextile was placed along the boundaries of SA-6 South over the HB and SCB wall located along the western, northern, southern, and eastern boundaries of the cap. The 15 ft. wide geotextile panels were placed with approximately 13 ft. inbound of the perimeter of the HB and SCB walls, along with 2 ft. of geotextile extending outbound of the perimeter containment walls.

Geotextile panels were overlapped at least 12-inches and seamed using a dual hot wedge welder that melted the two surfaces together to form a bond (also referred to as leistering). The 16 oz. geotextile was placed along the boundary areas of SA-6 at locations above the Site water table (i.e. locations where geosynthetic clay liner was not required). The geotextile (on the interior of the Cap) overlapped the geocomposite venting layer and was leistered in place following the procedure outlined above. *Figure 2* below shows the 16 oz. geotextile being placed over the HB wall (southern end of SA-6 South cap), and *Figure 3* shows the geotextile overlapping the GVL Note, the GVL roll was placed in a general north to south direction across SA-6, while the 16 oz. geotextile roll was placed in a general east to west direction.

**Figure 2 – 16 oz. Geotextile Placed Over HB Wall (southern end of SA-6 South)**

**Figure 3 – 16 oz. Geotextile / GVL Over SCB Wall (northern end of SA-6 South)**

### *2.4.2 Geocomposite Venting Layer (GVL)*

Prior to placement of the 60-mil LLDPE geomembrane, GVL was placed over the soil subgrade at locations above the water table to serve as a venting layer for naturally occurring methane that may emanate from below the cap.

The approved GVL (i.e., defined as SKAPS TN-220-2-6 in *EOR Closure Report*) consisted of an extruded polyethylene drainage net structure (or geonet) sandwiched between two non-woven geotextile layers. The GVL was delivered to the Site, offloaded, and staged onsite by Entact. The RIRs for the GVL delivered to the Site are provided in *Appendix G*.

The GVL was placed by ESI, over the approved soil subgrade for areas above the Site water table at locations shown on the Record Drawings (*Appendix A1*).

The GVL rolls were typically oriented in a north to south direction. The leading edge of the GVL panels was held in place by sand bags until the subsequent panels could be placed and seamed. The placement strategy for this material was to limit the amount of GVL to be placed in a day, to an area that could also be covered by the LLDPE geomembrane that day. This strategy was used to minimize the risk of the GVL and underlying subgrade from becoming wet during overnight rain events. GVL panels were not placed during precipitation events, in the presence of excessive moisture, or during high winds.

GVL panels were placed according to Section 02380 – Gas Venting System as defined in *100% Design* package. GVL was generally placed with the predominant flow direction towards the edge of the cap with the GVL running parallel to any slopes or elevation changes (i.e. running up/down the slope and not across the slope). For adjacent GVL panels, the following minimum seaming requirements were met:

- Adjacent rolls of GVL were placed so that the geonet overlapped by 2 to 3-inches, and the geotextiles overlapped by at least 4-inches;
- The bottom layer of geotextile (underneath the geonet) was overlapped to ensure that no areas of the soil subgrade were exposed;
- White plastic fasteners were placed at a maximum of every 5 ft. along the seam to connect adjacent pieces of GVL. Additional fasteners were requested by the QA team when the seams extended down slopes or at significant subgrade elevation changes. *Figure 4* below shows placement of the white plastic fasteners; and
- Once the geonet was tied with a sufficient number of fasteners, the top geotextile of the GVL was continuously sewn as shown in *Figure 5* below.

**Figure 4 – Typical Placement of GVL & Joining of the Net with Plastic Fasteners**

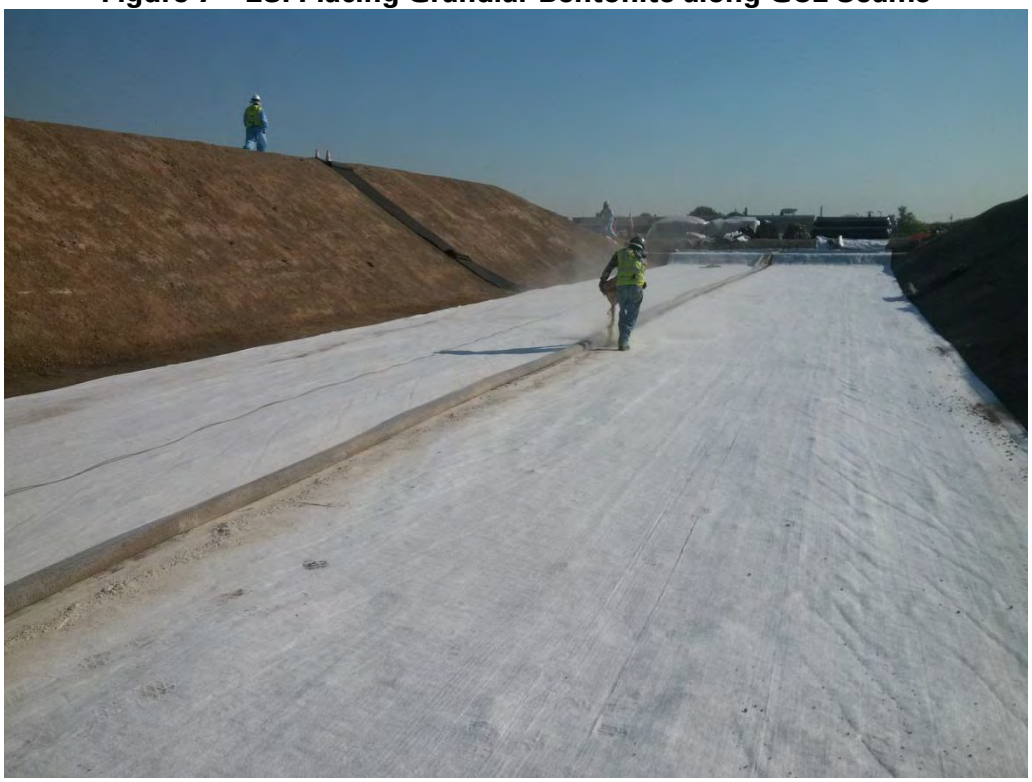
**Figure 5 – Typical Sewing of GVL (for top layer of geotextile)**

During placement of the GVL, butt seams, rips, tears, or other damaged areas of the GVL were repaired by exposing an appropriate area of geonet, placing fasteners as defined in the project specifications, and covering the area with a new piece of geotextile which was leistered in-place. Additional details of the GVL placement are further described in the Langan Daily Reports and Photo Logs provided in *Appendix F*.

### *2.4.3 Geosynthetic Clay Liner (GCL)*

The approved GCL consisted of granular sodium bentonite clay sandwiched between, supported, and encapsulated by two geotextiles, and held together by needled punching. The approved GCL (i.e., Cetco Bentomat DN) was delivered to the Site, offloaded, and staged onsite by Entact. The RIRs for the GCL rolls delivered to the Site are provided within *Appendix G*.

The approved GCL was deployed by ESI in accordance with Section 02375 – Geosynthetic Clay Liner as defined in the *100% Design* package. GCL was placed directly over the approved soil subgrade, at locations situated below (to 1 ft. above) the Site water table. These areas generally consisted of: the bottom of utility corridors, the bottom of drainage swales and Site elevation changes, and the eastern end of SA-6 South (where the subgrade is depressed to allow the surface grading to tie in with Route 440). These locations are shown on the Record Drawings.



For areas where the edges of the GCL terminated on a slope, staples were used to secure the GCL in place as shown below in *Figure 6*. The staples were placed along the top 6-inches of the GCL edge and were placed through the GCL and secured into the underlying soil subgrade. The GVL overlapped the edge of the GCL a minimum of 12-inches and was then leistered to the GCL. When staples were used, the GVL was placed over the staples (at least of 1 ft. of overlap), to mitigate the potential of the staples coming in contact with the geomembrane.

**Figure 6 – ESI Securing GCL with Staples**

During placement of the GCL, granular bentonite was placed along the GCL seams as outlined in the project specifications and shown on *Figure 7* below. No GCL was placed during precipitation, in the presence of excessive moisture, or during high winds.

**Figure 7 – ESI Placing Granular Bentonite along GCL Seams**

Additional details on the placement of the GCL are further described in the Langan Daily Reports and supporting photo logs provided in *Appendix F*.

#### *2.4.3.1 Bentonite Sand Plug*

As outlined in specification Section 02375 – Geosynthetic Clay Liner of the *100% Design* package, a sand bentonite plug was constructed on the inboard side of the HB wall for the low-lying areas (below the Site groundwater table) along the edges of SA-6 South. This bentonite sand plug was constructed in the field by Entact by mixing clean sand with sodium montmorillonite at a 90% sand to 10% bentonite ratio.

The plug was constructed to a depth of approximately 18-inches below the HB wall elevation, and was approximately 2 ft. thick. Additional details on the edge connection details are provided below in *Section 2.4.3.2*. *Figure 8* below also shows the typical construction of the bentonite sand plug along the HB wall.

**Figure 8 – Typical Construction of Bentonite Sand Plug along HB Wall**

#### *2.4.3.2 GCL to Barrier Wall Connection Details*

GCL to Barrier Wall Logs are provided within *Appendix H*. As per the approved Langan CQA Plan, Amec Foster Wheeler completed a GCL to Barrier Wall (HB Wall & SCB) Connection Detail form for the low-lying areas of SA-6 South (below the Site water table). This form documented that the bentonite sand plug was appropriately constructed, that the barrier wall was clean and exposed, and that the appropriate GCL overlap (1 ft. minimum) was maintained.

### 2.4.4 60-mil Low Linear Density Polyethylene (LLDPE) Geomembrane

A textured LLDPE geomembrane manufactured to a nominal 60-mil thickness was placed over the GVL and GCL layers at the Site to mitigate groundwater infiltration through the cap. The rolls of the approved 60-mil LLDPE geomembrane were delivered to the Site, offloaded, and staged onsite by Entact. The RIRs for the LLDPE geomembrane are provided in *Appendix G*.

The 60-mil LLDPE geomembrane was placed directly over the GVL and GCL geotextiles. The 60-mil geomembrane was placed in accordance with specification Section 02372 – Cap Geomembrane Liner as defined in the *100% Design* Package. The location and placement of the LLDPE panels is documented on the ESI Panel Placement Logs provided in *Appendix I*.

ESI deployed the geomembrane rolls in a general north to south orientation. Hand clamps were used on the edge of the panels to aid in the final positioning, as required. The leading edge of the LLDPE geomembrane panels were held in place by sand bags until the subsequent panels

could be placed and seamed via fusion welding methodology. The number of panels deployed in a single day was limited to the amount that could be field seamed that day. No panels were placed during precipitation, in the presence of excessive moisture, or during high winds. The minimum temperature for seaming was specified as 32°F, with a maximum temperature of 104°F. No cold or hot weather seaming was conducted as temperatures did not reach below 32°F, or above 104°F during geomembrane installation.

Each individual LLDPE panel was observed for damage by ESI, Entact, and Langan during the installation process. Prior to seaming, the approved geomembrane was observed by Langan to ensure that the material was free of defects or damage prior to seaming. Areas observed to be damaged / defective, or areas where the geomembrane had to be custom cut to conform to the subgrade contours, were marked for repair. Repairs were completed in the field by ESI via patching and welding the geomembrane as further described below. All repairs were documented and recorded on the Record Drawings (*Appendix A2*). Additional details on the repair methodology and types of repairs are further described in *Section 2.4.4.4*.

The LLDPE geomembrane was seamed in the field by two welding methods: extrusion and double-fusion. Extrusion welding was used for repairs, short seams, and areas where the double fusion could not operate. Extrusion welding was performed with a hand held extrusion welding gun. The double-fusion seaming (fusion welding) was performed using a self-propelled "wedge welder" which formed an air channel between the two seams. Fusion welding was performed with a minimum of 4-inches overlap as per the project specifications.

The integrity of the welds was monitored by both destructive and non-destructive test methods. The destructive testing consisted of collecting samples from the completed seams at a minimum frequency of one sample per 500 ft. of weld (for both fusion and extrusion welds). A representative of Langan was onsite to confirm the locations of the destructive samples along with a representative of ESI.

The destructive samples were analyzed by Geotechnics, Inc. (Geotechnics) the Contractor's Material Quality Control Laboratory. Langan also collected additional QA samples (approximate 15% of total samples collected) and submitted samples to TRI Environmental, Inc. (TRI) for independent QA testing. Destructive sample locations were repaired in the field and tested with a vacuum box. All destructive sample locations have been recorded and are shown on the Record Drawings (*Appendix A2*). The laboratory results of the destruct samples are discussed further in *Section 2.4.4.3* below.

In addition to the destructive testing, non-destructive testing was completed by ESI during cap construction. Two types of non-destructive tests were used at the Site: air channel tests (pressure tests) and vacuum box tests as defined further below:

1. Pressure Testing - The pressure tests were conducted on 100% of all the double fusion welded seams where both ends of the seam were clamped and sealed and a pressure needle was inserted into the air channel. The air channel was then pressurized to thirty pounds per square inch (psi) and the pressure was maintained for a minimum of five minutes. If the pressure did not stabilize, or a pressure drop greater than four psi was noted over a five minute span, then the seam was deemed unacceptable and the faulty

area was isolated and repaired. Results of the non-destructive testing are discussed further in *Section 2.4.4.2* below.

2. Vacuum Box Testing - For patch / repair work and other areas where extrusion welding was required, the extrusion welds were vacuum box tested by ESI. A soapy solution was applied to the weld area, and a vacuum box was placed over the weld for a minimum of ten seconds and observed for the appearance of soap bubbles. Any areas where these bubbles appeared were marked, repaired, and retested. Any areas that failed the vacuum box test were identified as a non-compliance issue and are discussed further in *Section 2.4.6* below.

At seams or locations where vacuum box or pressure testing could not be conducted (i.e. boot penetrations), the extrusion welds were visually inspected by observing the welding process and checking the weld for uniformity and completeness. Individual forms were generated to document the installation of each boot / penetration. Additional details on the pipes / penetrations encountered on the cap are further described in *Section 2.4.4.5*.

For additional details on the geomembrane placement, destructive and non-destructive testing, patch / repair work, and other geomembrane related construction activities, refer to the Langan Daily Reports and Photo Logs provided in *Appendix F*.

#### *2.4.4.1 Trial Weld Logs*

Prior to any seaming of the geomembrane each day, the fusion and/or extrusion welding equipment was used to conduct trial welds (or test strips) to confirm that the material and equipment met the specification requirements. Test strips were collected (using the same 60 mil LLDPE geomembrane placed across the cap) by completing a sample fusion or extrusion weld. This activity included producing several types of seams to qualify that a specific seamer and apparatus would yield the desired specified performance requirements. These seam types included: smooth-to-smooth, smooth-to-textured, and textured-to-textured. It should be noted that the 60 mil geomembrane installed across the cap was textured (60-mil Microspike); however, the manufacturer's product has a smooth edge for welding.

The trial welds were cut and tested on a portable tensiometer by ESI. Langan and Entact observed the trial weld tests to confirm that the minimum peel and shear values were obtained (as per specification Section 02372 – Cap Geomembrane Liner defined in the *100% Design* package). These trial welds were completed prior to commencement of seaming at the start of each day, and once every four hours. The results of daily trial weld logs are provided in *Appendix J*.

#### *2.4.4.2 Non-Destructive Testing Results*

Non-Destructive Pressure Testing was conducted along the geomembrane panels, and the repaired / patched areas (i.e., using vacuum box testing) by ESI, as per the project specifications. The results of the non-destructive testing for each of the panel seams were provided in the Seam Control Logs shown in *Appendix K*. Additionally, the associated repairs

and the corresponding vacuum box testing results are presented in the ESI Repair Report attached in *Appendix L*.

During the construction of the cap at SA-6 South, there were two non-destructive tests (one pressure test and one vacuum box test) that failed during the field testing which consisted of the following:

1. Failed non-destructive (pressure) test for geomembrane panel seams Panel #7 / Panel #8 and identified as Repair (RP)-13 (as shown on the Record Drawings); and
2. Failed non-destructive test (vacuum box test) for repair RP-215 (Panel #50).

Both of these failures were subsequently repaired by ESI in general accordance with specification Section 02372 – Cap Geomembrane Liner and were documented as non-compliance issues which are further described in *Section 2.4.6* below.

#### *2.4.4.3 Destructive Testing Results*

Destructive testing was conducted for the fusion and extrusion welding that was completed along the edge of the geomembrane panels. Destruct samples were collected at a minimum sampling interval of 500 linear feet (LF) of seaming length for the initial twenty-five (25) samples. The locations of the destruct samples were identified in the field by the Independent QA Monitor (Langan) and are shown on the Record Drawings (*Appendix A2*). Once the destruct sample locations were determined, ESI cut and tested the destruct samples (as per the project specifications).

Six 1-inch wide specimens were cut from the destruct sample for field testing. These samples were then tested by a tensiometer equipped with a drive/pull apparatus rate of 20-inches per minute. Three of the specimens were tested for peel strength, and the remaining three for shear strength. The samples were tested to confirm that the geomembrane met the specified peel and shear strength values outlined in *Table 1* below. Additional details on the test results are provided on the Destructive Sample Information Logs attached as *Appendix M.*

**Table 1 – LLDPE Geomembrane Seam Property Requirements**

| Property | Test Method | 60-mil LLDPE Value |
|---|---|---|
| Shear Strength (min. avg.) | ASTM D 6392 | 90 lb/in |
| Peel Strength – Extrusion (min. avg.) | ASTM D 6392 | 66 lb/in |
| Peel Strength – Fusion (min. avg.) | ASTM D 6392 | 75 lb/in |

In addition to the field testing completed by ESI, a total of twenty-nine (29) fusion weld destruct samples, and fifteen (15) extrusion weld samples were sent to Geotechnics for lab verification.

A total of twenty-nine (29) fusion weld destruct samples (DS-1 through DS-29) were collected during the capping of SA-6. For the first 25 QA samples collected, all samples met the specified destructive testing requirements outlined in *Table 1*. As per the specification, the frequency of fusion weld destruct sampling was reduced from every 500 LF of welded seam to every 1,500 LF of welded seam. A summary of the peel and shear QA testing conducted for the 29 fusion weld samples collected is summarized in *Appendix N*.

A total of fifteen (15) extrusion destruct samples were collected throughout the capping of SA-6 South. *Table 2* below summarizes the results of the extrusion weld destruct samples collected as well as the corresponding laboratory data, peel and shear averages, and compliance with specification Section 02372 – Cap Geomembrane Liner outlined in the *100% Design* package.

As highlighted above on *Table 2*, one destruct sample DSX-13 failed to meet the peel strength criteria for one of the five specimens tested. While the average of the five specimens tested for this specimen did comply with the project specifications, the extrusion weld in this area was designated as non-compliant. As such, the weld was subsequently patched, repaired, and re-tested and documented as Repair RP-487 in *Appendix L*. An additional extrusion weld destruct sample was collected and labeled as DSX-15. Additional details on this non-compliance issue are described in further detail in *Section 2.4.6*.

In addition, Langan collected a total of six QA samples (4 fusion weld samples and 2 extrusion weld samples) to verify the results of the Geosynthetic Installer's laboratory data. Langan's QA

samples were submitted to Texas Research Institute Environmental, Inc. (TRI). The results of the ESI and Langan destruct samples indicated that the peel and shear strength values met the requirements outlined in the project specifications. Furthermore, the additional QA samples collected by Langan yielded values that were in close proximity to the values obtained by ESI (which were generally lower than the values obtained by Langan's QA laboratory). The Laboratory Destruct Test Results are provided in *Appendix N*.

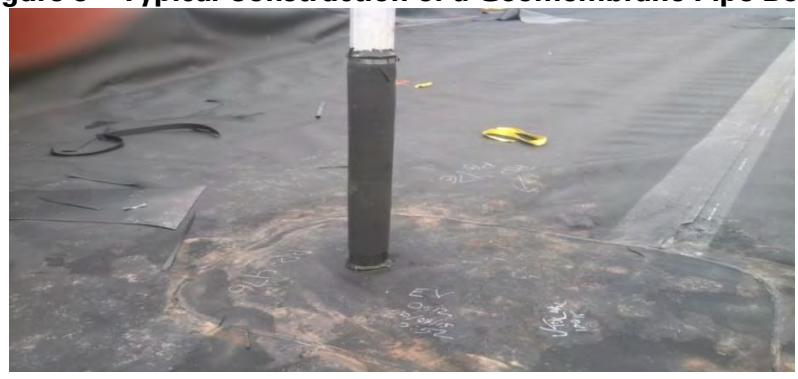
#### *2.4.4.4 Repair Reports*

The ESI Repair Report is provided in *Appendix L*. Several different types of repairs were observed and recorded during field activities by ESI. These corresponding repairs are shown on the Record Drawings (*Appendix A2*), and consisted of the following types:

- Custom Fit Repairs (CF) – Custom Fit Repairs consisted of areas of the geomembrane cap where the geomembrane was cut (and subsequently repaired) to allow the geomembrane to conform to the cap contours. These areas were typically located where there were abrupt elevation changes, such as drainage and utility swales, utility corridors, and planting areas;
- Wrinkles (WR) – Wrinkles consisted of areas where excess geomembrane was observed. Where the size of the wrinkle was determined to be detrimental to the geomembrane (i.e. wrinkles with the potential for folding), the wrinkle was cut, and the excess geomembrane was overlapped and sealed with an extrusion weld in accordance with the project specifications;
- Roller Wrinkles (RW) & Burnouts (BO) – Roller wrinkles can occur when slight differences in length between the two geomembrane edges being welded resulted in formation of a wrinkle along the geomembrane seam. Wedge burnouts occurred where the wedge became jammed thus causing the welder to burn / melt through the geomembrane seam. These areas were subsequently patched and repaired according to the project specifications;
- Destruct Samples (DS) – These areas consisted of the geomembrane destruct samples that were cut for laboratory testing. The removal of the sample creates a hole in the seam, thus these areas were subsequently patched according to the project specifications;
- Pipe Boots (PB) – Pipe boots were installed where penetrations of the geomembrane occurred such as at wells, piezometers, gas vents, and access manholes. Additional details are provided in *Section 2.4.4.5;*
- Add On (AO) – AO areas consisted of sections of SA-6 where an additional piece of geomembrane was required to finish a geomembrane run across the cap (from north to south);
- Seam Joints (SJ) – Seam joints consisted of the areas where non-destructive testing (pressure testing) was conducted along a "T" section of the geomembrane;
- Subgrade Irregularities (SI) – Subgrade Irregularities consisted of areas along the geomembrane cap where a rock or object larger than ½-inch in diameter was encountered underneath the geomembrane after the material had been placed. These

areas were subsequently cut, the rock/debris removed, and the area patched / repaired according to the project specifications. These SIs were identified as non-compliance issues and are discussed in further detail in *Section 2.4.6* below;

- Damage By Others (DO) – DO consisted of damage / punctures to the geomembrane cap caused by equipment or personnel during grading of the protective cover soil. These DO instances were identified as non-compliance issues and are discussed in further detail in *Section 2.4.6* below.
- Failed Seam (FS) – Failed seams consisted of fusion / extrusion weld samples that were collected, and failed to meet the strength criteria of the material as outlined in Section 02372 – Cap Geomembrane Liner presented in the *100% Design* Package (and summarized in *Table 1*). These FS instances were identified as non-compliance issues and are further described in *Section 2.4.6* below.



For additional details on the geomembrane repairs and non-compliance issues observed during field activities refer to the *Appendices L and P,* respectively.

#### *2.4.4.5 Geomembrane Penetrations & Pipe Boot Installation*

The geomembrane penetration and pipe boot logs are provided in *Appendix O*. The pipe boots were field fabricated by ESI, and the boots were installed at monitoring wells, gas vents, piezometers, and access manhole penetrations across the cap.

The geomembrane boots consisted of a vertical (minimum of 2 ft.) section of LLDPE being wrapped around the penetration (i.e. well, gas vent, etc.) from the base to the top of the penetration. The geomebrane wrap was then heat sealed and an extrusion weld was placed with a vertical seam connecting the two pieces of geomembrane. The end of the boot terminated in a skirt section which was placed over the boot. The skirt and the geomembrane overlapped a minimum of 18-inches and the skirt was welded to the geomembrane. A neoprene rubber gasket was used between the boot and the penetration and secured with a 1-inch wide stainless steel clamp (or two ½-inch clamps). An LLDPE sacrificial sheet was then placed between the boot and the clamp for protection and a butyl sealant was applied along the top of the boot. *Figure 9* below shows the typical construction of a geomembrane pipe boot in the field by ESI. The welding of each boot was observed by Langan, and each boot fabrication was documented on an individual boot fabrication form provided in *Appendix O*. The four typical types of penetrations present on the SA-6 South cap are defined below.

**Figure 9 – Typical Construction of a Geomembrane Pipe Boot**

*2.4.4.5.1 Monitoring Wells*

A total of four (4) monitoring wells were located within the SA-6 South cap. The monitoring wells were constructed with PVC and were encased in a 4-inch metal casing. Refer to *Appendix O* for the penetration and boot logs for monitoring wells: 073-MW-1BR, 115-E1A-SO, 115-W3-SO, and 115-W5-SO.

*2.4.4.5.2 Gas Vents*

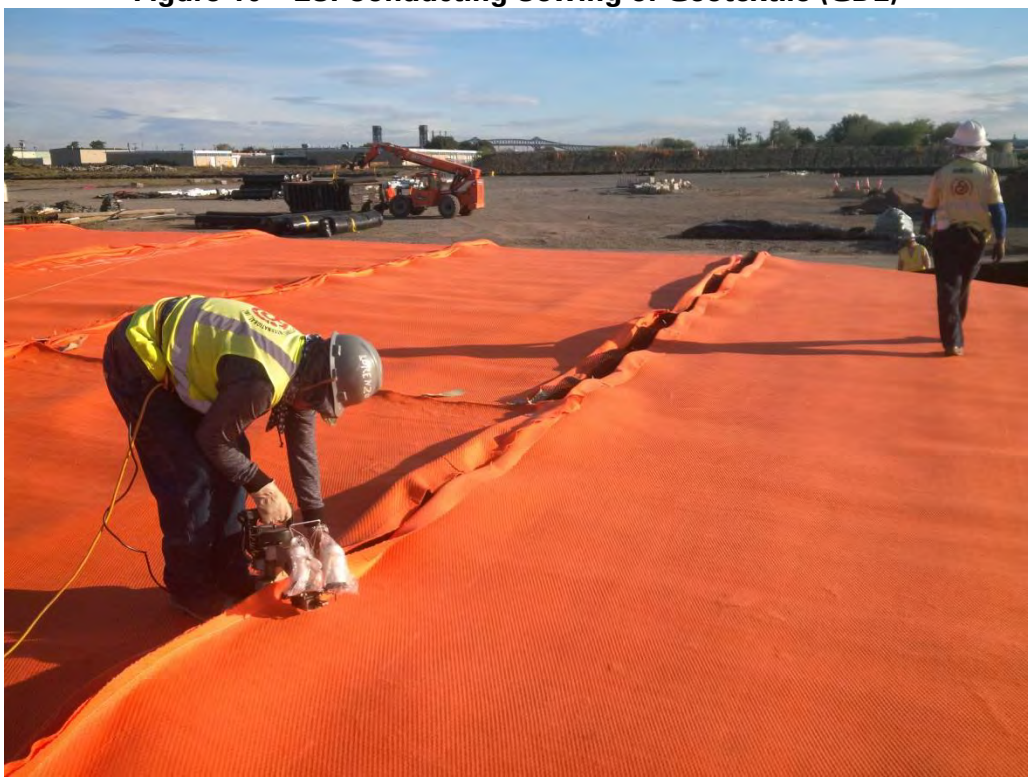
A total of eight (8) gas vents were constructed through the cap. Gas vents were completed in accordance with Section 02380 – Gas Venting System of the *100% Design* Package to allow any naturally occurring methane to vent to the atmosphere. Refer to *Appendix O* for the penetration and boot logs for gas vents GV-0 through GV-7, with the corresponding locations shown on the Record Drawings (*Appendix A2*).

*2.4.4.5.3 Piezometers*

A total of five (5) piezometers were installed through the cap to allow the project team to compare the groundwater within capped area to the groundwater immediately outside of the cap. Piezometers were encased within a 4-inch steel casing. Refer to *Appendix O* for the penetration and boots logs for piezometers PZ-12, PZ-14, PZ-16, PZ-18, and PZ-20, and to the Record Drawings (*Appendix A2*) for the corresponding piezometer locations.

*2.4.4.5.4 Pump Station and Access Manholes*

A total of one pump station and three (3) access manholes were completed with field fabricated geomembrane boots. Refer to *Appendix O* for the penetration and boot logs for Access Manhole #1, Access Manhole #2, Access Manhole #3, and Access Manhole #4, with the corresponding locations shown on the Record Drawings (*Appendix A2).*



### 2.4.5 Geocomposite Drainage Layer (GDL)

To facilitate drainage and transport of infiltrated surface water off the cap, a geocomposite drainage layer (GDL) consisting of a geonet with a non-woven geotextile bonded to both sides (i.e., defined as SKAPS TN 330-2-6 ) was delivered to the Site, offloaded, and staged onsite by Entact in accordance with the project specifications. The RIRs for the delivered GDL rolls are provided in *Appendix G*. The GDL was placed at the Site by ESI and was placed directly over the geomembrane cap as shown on the Record Drawings (*Appendix A3*).

GDL panels were placed according to the specification Section 02374 – Geocomposite Drainage Layer as defined in the *100% Design* package. For adjacent GDL panels, the following minimum seaming requirements were met:

- Adjacent rolls of GDL were overlapped so that the geonet overlapped by 2 to 3-inches, and the geotextiles overlapped by at least 4-inches;
- The bottom layer of geotextile (underneath the geonet) was overlapped so that no areas of the underlying geomembrane were exposed;
- White plastic fasteners were placed at a maximum of every 5 ft. along the seam. Additional fasteners were requested by the QA team when the seams extended down the slopes or elevation changes were noted; and
- Once the geonet was tied with a sufficient number of fasteners, the top geotextile of the GDL was continuously sewn as shown in *Figure 10* below.

**Figure 10 – ESI Conducting Sewing of Geotextile (GDL)**

During placement of the GDL, butt seams, rips, tears, or other damaged areas of the GDL were repaired by exposing an appropriate area of geonet, placing fasteners as defined in the project specifications, and covering the area with a new piece of orange geotextile (same as the GDL geotextile) which was heat sealed in place.

Once the GDL was placed, Entact placed protective cover soil (i.e., 1 ft. layer of material) directly over the GDL. In addition, yellow caution tape was placed every 55-inches over the GDL prior to protective cover soil placement. The caution type had bold type which indicated "Danger Do Not Dig – Peligro No Excavar" in English and Spanish. Additional details on the GDL placement are provided in the Langan Daily Reports and Photo Logs provided in *Appendix F*.

### 2.4.6 Non-Compliance Issues

The Summary of Non-Compliance & Corrective Action Sheets are provided in *Appendix P*. During the SA-6 capping activities, any QA field tests, observations, or failed samples that did not comply with the project specifications were documented and recorded as a non-compliance issue. A total of twelve (12) non-compliance issues were identified throughout the capping of SA-6 South and are summarized below:

1. Subgrade Irregularities – Refer to Sheet Numbers 1, 2, 4, 6, and 8 of the Non-Compliance & Corrective Action Sheets (*Appendix P*). In general, the subgrade irregularities consisted of stones or other material greater than ½-inch in size that was encountered below the geomembrane cap after the material had been placed and

secured. These objects were removed by cutting the geomembrane, removing the object, and patching the geomembrane in accordance with the project specifications. The subgrade showed no indication of these items at the time of subgrade approval, and it is postulated that these items were dislodged from the subgrade as the GVL was drawn across the subgrade surface;

2. Subgrade Irregularity (Hydrated GCL) – Refer to Sheet Numbers 7, 9, and 10 (*Appendix P*). In general, the Hydrated GCL Subgrade Irregularities consisted of areas where the underlying GCL layer had become saturated following heavy rain events. The saturation of the GCL was due to the unfinished grading of the SA-6 cap, as well as equipment failures, which resulted in water ponding along the edges of the cap during high intensity rain events. This ponding caused the water to move laterally across limited portions of the cap thus wetting the GCL layer prior to cover soil placement. For these areas, the geomembrane was cut to expose the GCL followed by replacement of the wetted GCL. Visual observation of the underlying subgrade soils exhibited no damage or washout of the subgrade. Repair activities were conducted so that the resulting materials were placed in accordance with the project specifications;
3. Failed Vacuum Box Test – Refer to Sheet Number 5 (*Appendix P*). During vacuum box testing of repair RP-215, a failed extrusion weld was identified. As such, a new geomembrane patch (RP-222) was placed over the failed extrusion weld, and subsequently tested using the vacuum box to verify the integrity of the new weld;
4. Failed Non-Destruct Test – Refer to Sheet Number 3 (*Appendix P*). A failed non-destruct test (pressure test) was encountered along Panel Seams #7/8. Based on the length of the failed seam (approximately 6 ft. along the southern end of SA-6), the entire seam was patched and repaired (approximate 2 ft. by 6 ft. patch). Vacuum box testing was then conducted to confirm the integrity of the new extrusion welds;
5. Failed Destruct Sample – Refer to Sheet Number 11 (*Appendix P*). Extrusion weld destruct sample DSX-13, which was collected from repair RP-477, failed one of the five test specimens for peel strength testing (Note: averages of the five specimens conformed to the project specifications). A new patch was placed over RP-477, and was identified as a Failed Seam (FS). It should be noted that the new patch was identified as repair RP-486. Once completed, an additional extrusion weld destruct sample (DSX-15) was collected to confirm the new patch met the specification requirements. Subsequent laboratory testing confirmed that the DSX-15 destruct sample complied with the project specification strength requirements; and
6. Geomembrane Puncture (Equipment) – Refer to Sheet Number 12 (*Appendix P*). During final grading of the protective cover soil by Entact, an excavator bucket punctured the geomembrane liner along the northern end of SA-6 South (along the SCB Wall). This puncture was subsequently repaired / patched, welded, and vacuum box tested by ESI, according to the project specifications. The repair associated with the puncture was identified as repair RP-488, and was listed as Damage by Others (DO).

Additional details on the non-compliance issues encountered, as well as the subsequent repair activities, are further described in the Langan Daily Reports and Photo Logs provided in *Appendix F*.

# 3.0 DECLARATIONS

## 3.1 General

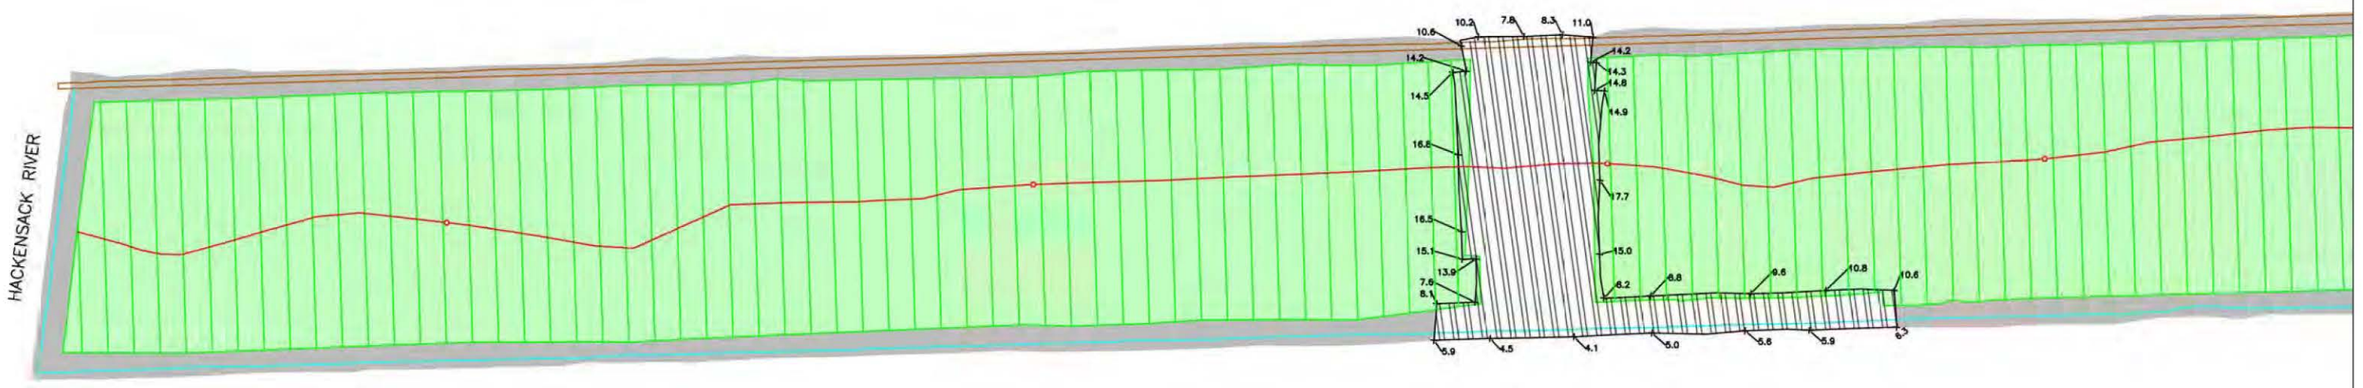
Langan personnel have monitored the construction and field activities completed for the capping of SA-6 South specific to the subgrade preparation and placement of the geotextile and geocomposite materials as defined herein. Based on the field observations made by Langan along with the field and laboratory test data collected by the Contractor and Subcontractors, it is our professional opinion that the construction observed at SA-6 South complied with the approved *100% Design* package. Additional details on the work and approval of materials is outlined in the *EOR Closure Report*.

## 3.2 Limitations

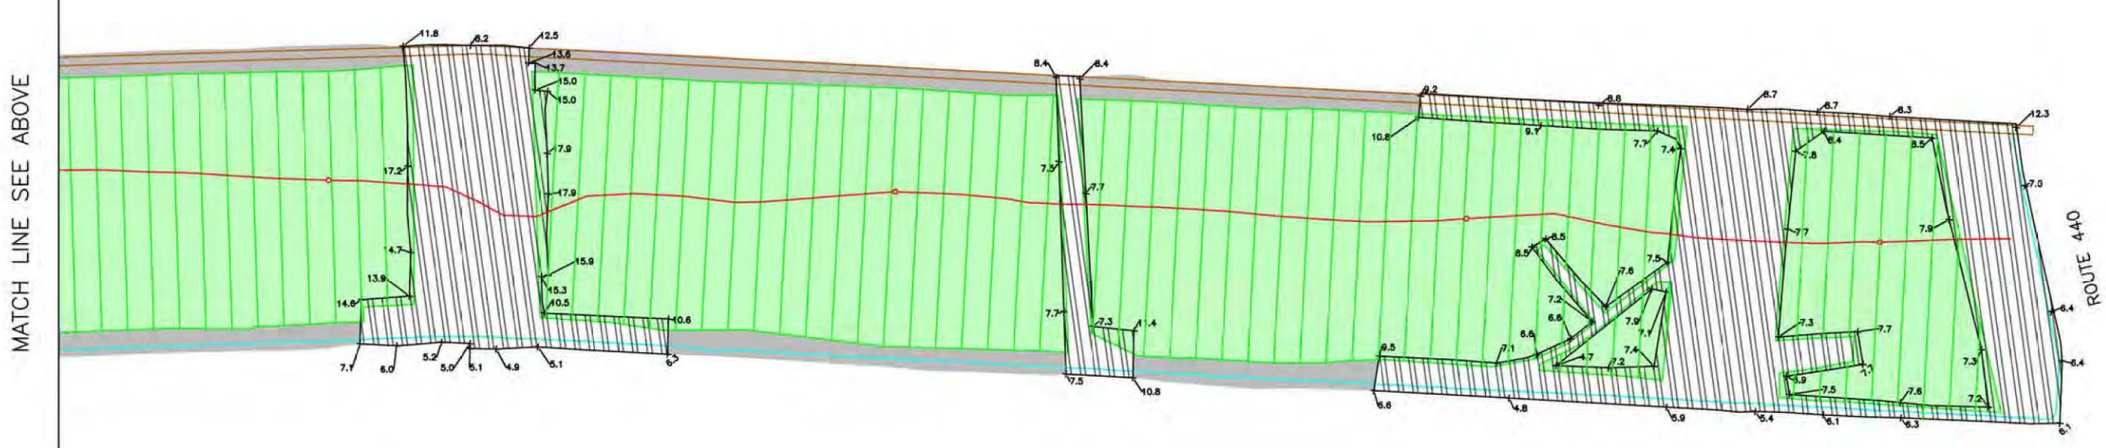
This Cap Geosynthetic Quality Assurance Report (QA Report) was prepared by Langan (in conjunction with Amec Foster Wheeler) for the exclusive use of Honeywell. This QA Report applies specifically to the subgrade preparation and construction of the geosynthetics components of the SA-6 South cap only.

The construction observations and monitoring were conducted under the conditions stated. Conclusions made in this report were based on these observations and data obtained from field and laboratory tests conducted on the QA samples collected.

The topographic survey measurements were completed by Entact and their licensed surveyor Maser and subject to review and approval by Amec Foster Wheeler. Langan did not independently verify the accuracy of this data.



Acceptance of the geosynthetic materials used for the SA-6 South cap construction was completed by Amec Foster Wheeler. Furthermore, the QC laboratory testing was completed by Geotechnics (under the direction of Entact) and QA laboratory testing was completed by TRI (under the direction of Langan).



The approval of all materials used for this project was completed by Amec Foster Wheeler in the *EOR Closure Report*. The geosynthetic production quality testing was completed by AGRU America, Inc. and their subcontracted companies working on their behalf. Langan did not independently verify the accuracy of the conformance test data.

## 1.0 INTRODUCTION

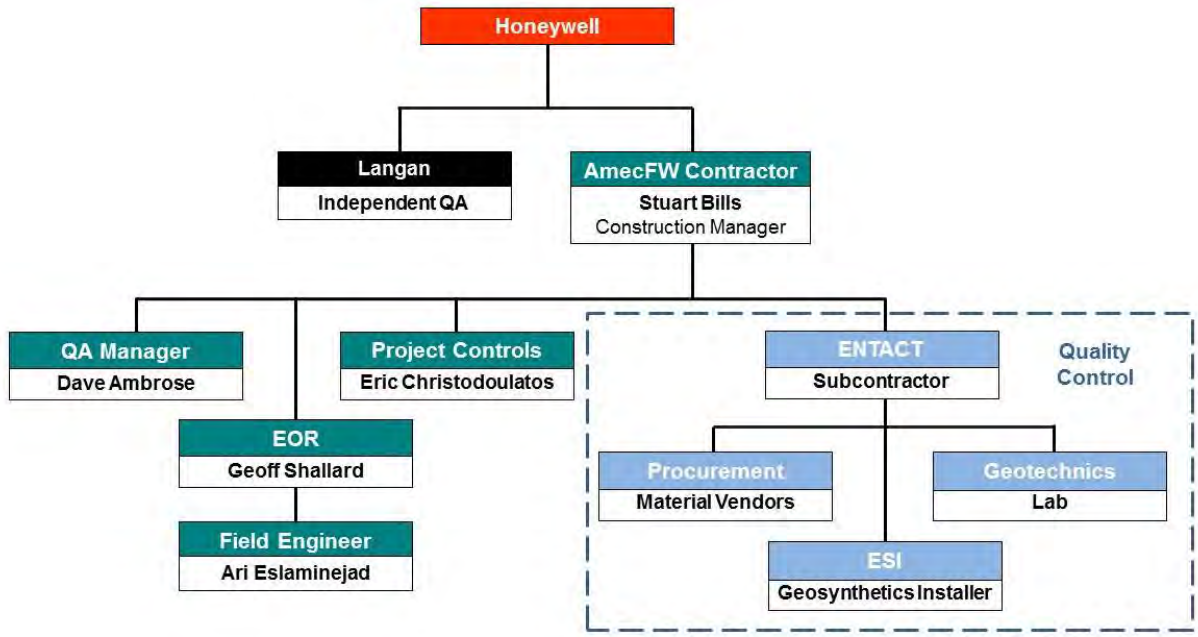
Honeywell International Inc. (Honeywell) is currently remediating Study Area 6 (SA-6), located in Jersey City, New Jersey (Site). SA-6 encompasses work in two areas: SA-6 North and SA-6 South, which are separated by Study Area 7 (SA-7). The Open Space areas at SA-6 North and SA-6 South will be covered with an engineered cap that includes a linear low-density polyethylene (LLDPE) geomembrane cover, a gas venting layer, a geocomposite drainage layer (GDL), a geosynthetic clay liner (GCL), and other related geosynthetic cap components. Technical specifications and design drawings for the engineered cap may be found in the document titled "100% Specification and Design Drawings."

Honeywell retained Langan Engineering and Environmental Services, Inc. (Langan) as the Independent Quality Assurance (QA) Engineer for the cap geosynthetics installation. This Construction Quality Assurance (CQA) Plan has been prepared in support of this site remediation project with pertinent supporting details outlined herein.

### 1.1 Purpose

The purpose of this CQA Plan is to describe the quality assurance and control procedures required for the construction of the geosynthetic components of the capping system for the Study Area 6 site, encompassing SA-6 North and SA-6 South.

The ultimate goal of this CQA program is to ensure that proper construction techniques and procedures are implemented throughout the course of this phase of the SA-6 project in accordance with the project specifications. Upon completion of the construction activities, a Cap Geosynthetics QA Report will be prepared.



All of the involved parties will receive a copy of this CQA Plan including the Owner, Construction Contractor, Capping System Subcontractor, Geosynthetic Installer, and the Independent Quality Assurance Engineer. The roles and responsibilities of these parties are outlined further in Section 2.0.

## 2.0 PERSONNEL RESPONSBILITIES, AUTHORITY, AND QUALIFICATIONS

### 2.1 General

The principal parties involved in the permitting, design, and construction of the final capping system for the SA-6 site include the Owner, Design Engineer, Construction Contractor, and the Independent Quality Assurance Engineer. Additional entities include the Geosynthetic Installer and Material Quality Control Laboratory. The project organization chart is shown on Figure 1. Descriptions of the individual parties are provided in the sections below.

**Figure 1 – SA-6 Liner Installation Organization Chart**

### 2.2 Owner

Honeywell, as Owner, is ultimately responsible for the construction of the capping of SA-6. The Owner has retained the Design Engineer, Construction Contractor, and the Independent Quality Assurance Engineer.

### 2.3 Design Engineer

Amec Foster Wheeler Environment & Infrastructure, Inc. (AmecFW), as the Design Engineer, was responsible for preparing the final design of the capping system, as well as plans and specifications for the construction work. The final design includes relevant aspects of the capping system, including details of the subgrade preparation, gas venting system, utility trenches, geosynthetic placement details, soil cover requirements, and other relevant design considerations. Samuel G. Shallard is the Engineer of Record (EOR) for AmecFW.

Technical specifications and design can be found in the document titled "100% Specifications and Design Drawings."

Personnel involved with the design engineering portions of the project are outlined herein:

- **Engineer-of-Record**
  Mr. Samuel Shallard shall serve as the Engineer of Record (EOR) and technical lead. Mr. Shallard will also be the lead engineer in resolving technical questions that arise during project execution.

- **Quality Assurance Manager**
  Mr. David Ambrose shall serve as the Quality Assurance (QA) Manager. He shall be directly responsible for subcontractor conformance to the technical specifications and project requirements.

- **Field Engineering**
  Ms. Ari Eslaminejad will serve as the EOR site representative.

### 2.4 Construction Contractor

AmecFW shall also serve as Construction Contractor (Contractor), and is responsible for constructing the soil capping system in accordance with the design criteria, plans, and specifications while using the necessary construction procedures and techniques. The Contractor has engaged ENTACT (Subcontractor) to support AmecFW with these activities.

A New Jersey licensed land surveyor will be contracted to conduct the licensed surveying tasks required in the contract documents and in this CQA Plan as well as to prepare the required record documents.

The Contractor shall provide sufficient project management and project supervision staff to ensure the submission and approval of materials, and that the execution of the work is completed in a timely manner and in accordance with the plans and specifications. Work shall be completed to the standards defined by this CQA plan and the plans and specifications. The Construction Manager, or a designated representative, shall be present during construction activities to oversee work by contractor personnel and/or subcontractor personnel. The Construction Manager or designated representative will coordinate activities directly with the Owner's representative and representatives of the Independent Quality Assurance (QA) Engineer. The Contractor shall be responsible for the repair or replacement of any items or work found defective. The Construction Manager will be supported by the AmecFW Quality Assurance Manager.

For the SA-6 capping project, AmecFW has provided a list of the capping construction team including subcontractors and corresponding responsibilities. A summary of these team members is provided below and presented on the organization chart shown on Figure 1.

- **Construction Manager**
  Mr. Stuart Bills shall serve as the AmecFW Construction Manager and Site Health & Safety Officer with the responsibility for the day-to-day Site activities. He shall report directly to the Honeywell Manager of Construction and the Honeywell Remediation Manager. Mr. Bills shall be responsible for the project implementation schedule, budget, and subcontractor oversight.

- **Project Controls**
  Mr. Eric Christodoulatos shall be responsible for coordinating and tracking submittal approvals and Request for Information (RFI) responses with the EOR. He will also be responsible for project financial cost and schedule tracking and projections.

- **Capping System Subcontractor – ENTACT**
  ENTACT is contracted to AmecFW to perform the cap construction. ENTACT will be responsible for installing the SA-6 capping system in accordance with "100% Specifications and Design Drawings." ENTACT will also be responsible for coordinating scheduling, project deviations, work plans, and any other pertinent construction details directly with the project team. ENTACT will report directly to AmecFW, and will provide the final construction details, including as-built drawings, upon project completion.

- **Geosynthetic Installer – ESI**
  ESI (Installer) is subcontracted to ENTACT. ESI will be responsible for installing the SA-6 geosynthetic materials in accordance with the project plans and specifications, and will work directly with ENTACT. ESI will also be responsible for coordinating scheduling, project deviations, work plans, and any other pertinent construction details directly with the project team.

- **Material Quality Control Laboratory – Geotechnics**
  Geotechnics is subcontracted to ENTACT. Geotechnics will be responsible for supplying laboratory testing results required as part of the capping project, such as destructive seam testing.

### 2.5 Cap Geosynthetics Quality Assurance Engineer

Langan has been retained by Honeywell to provide Independent Quality Assurance for the SA-6 Cap Geosynthetics installation. The Quality Assurance (QA) Engineer will perform the activities specified in this CQA Plan (i.e. monitoring, field oversight, and documentation) and provide a Cap Geoynthetics QA report at the conclusion of the project for the work observed. At a minimum, the Independent QA engineering staff will include a Geosynthetic QA Manager, QA Engineer, and on-site Field Technician, as outlined herein.

**Geosynthetic QA Manager – Mr. Jeffrey Stoicescu, P.E.**

**Duties:**

- Review design criteria, plans, and specifications for clarity and completeness so that the CQA Plan can be implemented.
- Advise the Lead Quality Assurance Engineer and On-Site Field Technician on CQA requirements and procedures. For similar projects, the project manager will support the EOR and field team members on a variety of Requests for Information and Submittals that will vary either the construction sequence or materials.
- Schedule and coordinate CQA inspection activities.
- Routinely update the Owner and Design Engineer on cap geosynthetic status throughout the duration of the geosynthetic portion of the project.
- Attend conference calls as required to provide potential solutions to requests when requested by the EOR.

**Authority:**

The Geosynthetic QA manager has the authority to determine whether or not materials, procedures, and/or installed materials meet the minimum project requirements, and to reject any materials, procedures, and/or installed work that fails to meet the project requirements. The project manager will advise the EOR, Contractor, and Owner of the rejection of materials, procedures, or installed work.

**Lead Quality Assurance Engineer – Mr. Dan Bosworth**

**Duties:**

- Direct and support the CQA personnel in performing observations and material tests;
- Confirm that the testing data is accurately recorded and maintained;
- Verify that the raw data is properly recorded, validated, reduced, summarized, and interpreted;
- Review and interpretation of data sheets and reports;
- Notify the Geosynthetic QA Manager of potential conflicts with the design drawings;
- Coordinate with the EOR to reject defective work and verify that corrective measures are implemented;
- Identify work that should be accepted, rejected, or uncovered for observation, or that may require special testing, inspection or approval.

**Authority:**

The Lead QA Engineer shall have the authority to observe and test any material and/or work, and render a decision as to whether the work is acceptable (based on the testing), and ensure that any work that does fail is removed and replaced with acceptable materials and/or workmanship.

**On-site Field Technician – Mr. Dan Bosworth and/or Mr. Connor Shields**

**Duties:**

- Perform site monitoring of the work in progress to assess compliance with the design criteria, plans, and specifications;
- Observe deliveries received on site as required on the Receiving Inspection Report provided as Appendix A2;
- Verify that the tests are conducted according to this CQA Plan;
- Report to the Lead QA Engineer results of inspections, including work that is not of acceptable quality or that fails to meet the specified design; and
- Complete inspection and testing forms as necessary.

**Authority:**

The on-site technician will have the authority to observe and test material and render a decision of whether the work is acceptable based on observation of testing and help ensure that work that does not conform to the approved plans and specifications is removed and replaced with acceptable materials and/or workmanship.

## 3.0 QUALITY CONTROL MEETINGS

### 3.1 Daily Tailgate Safety Meeting

A daily tailgate meeting will be held prior to commencement of any work activities for the day at approximately 6 A.M or time designated by the Construction Manager. The Contractor, Subcontractor, Geosynthetic Installer, and on-site quality assurance personnel involved in the field work procedures for that specific day shall be present at this meeting. The Daily Meeting shall include relevant aspects of the work for the day and its potential relationship to relevant health and safety (H&S) aspects outlined in their respective H&S plans. Individuals who arrive after the tailgate meeting has been conducted shall convene with the Construction Manager or other designate for the H&S briefing prior to starting work.

### 3.2 QA/QC Coordination Meeting

A QA/QC coordination meeting will be held prior to the construction of the capping system. Representatives of Honeywell, the EOR, the Construction Contractor, and the Independent QA Engineer will be present. The agenda for this meeting may include, but not be limited to:

- Familiarize each involved party with the CQA Plan and its role relative to the design criteria, site construction and closure plans, specifications, and construction documentation;
- Review the responsibilities of each involved party;
- Review the Contractor's projected work schedule and methodology;
- Determine any changes, if necessary, to the CQA Plan that are needed to ensure that the capping system will be constructed to meet the specific design;
- Review lines of authority and communication for each organization;
- Discuss the established procedures or protocol for observations and tests including sampling strategies;
- Discuss the established procedures or protocol for handling design change bulletins, construction deficiencies, repairs, and retesting;
- Review methods for documenting and reporting inspection data;
- Review methods for distributing and storing documents and reports;
- Review work area security and safety protocol;
- Review procedures for the location and protection of construction materials and for the prevention of damage to the materials from inclement weather or other adverse events;
- Conduct a site walk-around to review construction materials where available and to inspect equipment storage locations; and
- Minutes of the preconstruction meeting will be prepared by the Quality Assurance On-site field technician and will be distributed to all parties.

### 3.3 Progress Meeting

Progress meetings will be held once a week on Tuesdays at 8:30 A.M or at an alternate time designated by the Construction Manager. These meetings shall be scheduled between the primary parties involved with this project. At a minimum, a Representative of Honeywell, the Contractor's Construction Manager, the EOR, and a representative of the Independent QA team shall be present. At times, a subcontractor may be requested to attend as well.

### 3.4 Geosynthetic Pre-Installation Meeting

A progress meeting will be held prior to commencing installation of the geomembrane and/or geosynthetic materials. At a minimum the attendees shall be the Contractor's Construction Manager, the Lead Quality Assurance Engineer and On-Site Field Technician, as well as representatives from ENTACT and ESI. The agenda for this meeting will include but is not limited to the following:

- Discussion of CQA procedures and requirements;
- Review Panel Layouts;
- Review of Repair tracking methods and drawings;
- Discussion of procedures or protocol for observations and tests including sampling strategies;
- Installation sequence and methods;
- Projected work schedule; and
- Minutes of the geosynthetic pre-installation meeting will be prepared by the Project Controls representative and will be distributed to all parties.

### 3.5 Observation and Testing Records

There will be observation and testing records that will be utilized in conjunction with the construction oversight performed by the Quality Assurance (QA) Field Technician. The observation logs listed below contain the data to be recorded by the Quality Control Representative and can be found in Appendix A. The QA on-site field Technician will complete the following observation and testing records:

- Geomembrane Observation Records – The geomembrane inspection records forms consisting of:
    - Material delivery checklist (see Appendix A4)
    - Subgrade surface acceptance records (see Appendix A5)
    - Trial weld logs (see Appendix A6)
    - Panel placement record (see Appendices A7)
    - Panel seaming log (see Appendix A8)
    - Non-destructive testing log (see Appendix A9)
    - Repair log (see Appendix A10)
    - Conformance Test Chain of Custody Form (A11)
    - Destructive testing log (see Appendices A12 and A13)
    - Penetration Sealing Observation / Cap to Barrier Installation Observation (see Appendix A14)
    - Daily inspection report for the geomembrane liner (see Appendix A15)
- Other related forms including certification of completion (see Appendix A1), receiving inspection report table (see Appendix A2), and notice of non-compliance and corrective action form (see Appendix A16).

The QA on-site field technician overseeing geomembrane installation will independently document related data contained within the records listed above to provide the information to review the Contractor's geomembrane capping system subcontractor documentation prior to acceptance of the installed geomembrane cap. The Contractor shall provide access to the work

site and shall provide the QA on-site field technician access to all field data and records, as built drawings, and shall collect duplicate samples as required for testing by the QA on-site field technician laboratory subcontractor as required.

In addition, the on-site field technician will maintain a field notebook onsite to document observations, test results, weather conditions, work defects, etc. that occur during observation of construction activities.

## 4.0 CONSTRUCTION QUALITY ASSURANCE

### 4.1 General

The final capping system consists of the following layers, from bottom to top:

- A gas venting system (geocomposite drainage layer and vents);
- A 60-mil geomembrane LLDPE layer;
- A geocomposite drainage layer with warning layer;
- 12-inch thick geocomposite drainage layer cover soil;
- 16 oz woven geotextile root barrier; and
- Soil layers consisting of structural fills, planting soils, and capped with a 6-inch minimum topsoil layer.

The layers of the capping system are described in the sections below.

### 4.2 Subgrade Preparation

The subgrade layer of the capping system is shown on construction drawing C-301, provided in "100% Specifications and Design Drawings." The soil surface for the capping system (subgrade) is currently under construction to prepare the surface in accordance with the subgrade specification. These subgrade surface conditions will require review and approval by the Independent QA Engineer and Capping System Contractor and geosynthetics installer prior to placement of the geosynthetic materials as defined below.

#### 4.2.1 Quality Assurance

The subgrade observation and approval QA/QC forms have been provided in Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance to Section 02372 found in "100% Specifications and Design Drawings" and note deviations from the technical specifications;
- Observe subgrade preparation; and
- Review documentation to verify compliance.

Testing and installation documentation referenced above that is developed by the Subcontractor will be submitted to the QA Engineer for review. Copies of this documentation will be included as

part of the Cap Geosynthetics QA Report prepared by the Independent QA Engineer. The Cap Geosynthetics QA Report for the subgrade preparation shall, at a minimum, include the following:

- Documentation of qualifications of all contractors and CQA personnel.
- Daily reports prepared by the QA Engineer;
- Subgrade acceptance certificates for each area to be covered by the cap system, signed by the Geosynthetics Installer, the Subcontractor, and QA Engineer;
- Daily construction progress reports clearly showing subgrade preparation; and
- Quality control documentation, as detailed in this CQA Plan.

### 4.3 Gas Venting System

The gas vent layer shall be comprised of a layer of geocomposite drainage material and a gooseneck-shaped vent to facilitate communication between soil gas under the cap and the atmosphere. This gas venting system is shown on drawings C-121 and C-301 in "100% Specifications and Design Drawings."

Section 02374 from "100% Specifications and Design Drawings" is summarized on Table 1 and indicates the requirements for the geocomposite gas venting layer. Requirements include, but are not limited to:

- Packaging, shipment, and storage of material;
- Handling and placement requirements;
- Seaming procedures; and
- Material repairs.

The specification requirements for the goose-neck shaped vent, which have been provided in Section 02380 in "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Gas vent pipe materials; and
- Installation of the pipes via pipe laying, jointing, and pipe cutting.

#### 4.3.1.1 Quality Assurance

The GDL and gas vent QA/QC forms have been provided as Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Sections 02372 and 02380, provided in "100% Specifications and Design Drawings," and note deviations from technical specifications;
- Observe subgrade preparation;
- Overlapping of geocomposite and connection procedures;
- Material repairs;
- Observe pipe materials handling and storage;
- Observe installation of gas vent system; and
- Review of QC Documents to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Contractor will be submitted to the QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the QA Engineer. The Cap Geosynthetics QA Report for the geocomposite layer shall, at a minimum, include the following:

- Documentation of qualifications of all installers and CQA personnel;
- Daily reports prepared by the QA Engineer; and
- Daily construction progress reports clearly showing geocomposite and piping materials placed by date.

### 4.4 Geomembrane Layer

The geomembrane selected for use in the cover system is a 60-mil (0.060 inch) thick LLDPE. A microspike double-sided textured geomembrane has been approved for use on this project. Work shall consist of installing the LLDPE geomembrane and the overlying geocomposite in the areas as shown on the construction drawing C-301 provided in "100% Specifications and Design Drawings."

The specification requirements for the geomembrane layer, which have been provided in Section 02372 of "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Packaging, shipment, and storage of material;
- Handling and placement requirements;
- Non-destructive and destructive seam testing procedures; and
- Material repairs.

#### 4.4.1 Quality Assurance

Prior to the start of capping activities the geosynthetic installer shall provide the Design and Independent QA Engineers with a panel layout drawing.

The Subcontractor's installer shall furnish the certified test results for all geomembrane to be used to the EOR, or EOR representative, for review as part of the required shop submittals prior to shipment to the site. The EOR, or EOR representative, will review the test results for conformance with the criteria included in the contract specifications.

The geomembrane layer QA/QC forms have been provided as Appendix A. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Section 02372 provided in "100% Specifications and Design Drawings" and note deviations from technical specifications;
- Review subgrade preparation and approval to place geomembrane materials;
- Observe effect of weather conditions on geomembrane installation;
- Seam preparation;
- Seaming equipment and procedures;
- Overlapping and temporary bonding;
- Test seams;
- Non-destructive and destructive seam testing;

- Penetration sealing observations for gas vents, piezometers, and groundwater collection system manhole to the LLDPE.
    - Note cap to barrier exterior detail will be observed and documented by AmecFW field engineering representative.
- Repair procedures and testing ;
    - Defective areas may include:
        - Large holes, tears, cold bends, cracks, etc.:
        - Other localized flaws;
        - Small to large tears and large lengths of failed seams;
        - Areas of inadequate seams; and
- Documentation to demonstrate compliance.

Testing and installation documentation referenced above that is developed by the Capping System Subcontractor will be submitted to the QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the Independent QA Engineer. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The Cap Geosynthetics QA Report for the geomembrane layer shall, at a minimum, include the following:

- Summary of required submittals, documentation, and QC testing results outlined in Contractor's Construction Quality Assurance Plan (CQA)
- Daily reports prepared by the Quality Assurance Engineer.
- Record drawing(s) (panel layout with all associated data) received and approved by the QA Engineer.
- Subgrade acceptance certificates for each area to be covered by the cap system, signed by the Contractor's Installer and the Contractor.
- Relevant completed QA data sheets from Appendix A.

### 4.5 Geocomposite Drainage Layer 2 (Surface water infiltration drainage)

The cap cross-section will utilize two layers of drainage net. The geocomposite drainage layers (GDLs) will be both directly above and below the 60-mil geomembrane layer as shown on drawing C-301 in "100% Specifications and Design Drawings." The GDL above the membrane is allow for drainage and transport of infiltrated surface water, and the GDL below the membrane is for gas venting. This section focuses on the installation of the GDL above the membrane.

The specification requirements for the geomembrane layer, which have been provided in Section 02374 in "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Packaging, shipment, and storage of material;
- Handling and placement requirements;
- Seaming procedures;
- Material repairs; and
- Cover soil placement for the GDL above the geomembrane.

### 4.5.1 Quality Assurance

The geocomposite manufacturer shall provide certified copies of laboratory test results on the following specifications listed in Appendix A.

The Construction Contractor will furnish the certified test results for all geocomposite placed to the QA Engineer for review as part of the required shop submittals. The EOR, or EOR representative, will review the test results for conformance with the criteria included in the contract specifications.

The GDL QA/QC forms have been provided as Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Section 02372 of "100% Specifications and Design Drawings" and note deviations from technical specifications;
- Observe subgrade preparation;
- Overlapping and connection procedures;
- Material repairs; and
- Documentation to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Capping System Subcontractor will be submitted to the Independent QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the Independent QA Engineer. The report sections outlining the geocomposite layer shall, at a minimum, include the following:

- Daily reports prepared by the Independent QA Engineer; and
- Daily construction progress reports clearly showing geocomposite placed by date.

## 4.6 Root Barrier

The capping system shall contain a woven geotextile root barrier layer. This barrier layer is located directly above the GDL cover soil layer, as indicated in drawing C-301 in "100% Specifications and Design Drawings."

The specification requirements for the geotextile layer, which have been provided in Section 02373 of "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Product materials;
- Application of geotextile; and
- Installation of geotextile fabrics.

### 4.6.1 Quality Assurance

The QA/QC forms have been provided as Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Section 02373 of "100% Specifications and Design Drawings" and note deviations from technical specifications;
- Observe geotextile installation;
- Overlapping;
- Material repairs; and
- Documentation to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Contractor will be submitted to the QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the QA Engineer. The relevant sections of report outlining the geotextile layer shall, at a minimum, include the following:

- Daily reports prepared by the QA Engineer; and
- Daily construction progress reports clearly showing geotextiles placed by date.

## 4.7 Geosynthetic Clay Liner

The geosynthetic clay liner (GCL) shall be used as a secondary hydraulic barrier in locations where the cap may be submerged below the groundwater table, as indicated on drawing C-309 provided in "100% Specifications and Design Drawings."

The specification requirements for the clay liner, which have been provided in Section 02375 in "100% Specifications and Design Drawings" as well as summarized on Table 1, includes, but are not limited to:

- Material delivery, handling, and storage;
- GCL placement;
- Seaming; and
- Damage repairs.

### 4.7.1 Quality Assurance

The various technical specifications pertaining to the GCL are outlined within the QA/QC forms contained within Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, but are not limited to:

- Confirm work has been completed in accordance with Specification Section 02375 and note deviations from technical specifications;
- Observe geotextile installation;
- Observe overlapping and seaming of GCL;
- Material repairs;

- Observe GCL hydration; and
- Documentation to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Contractor will be submitted to the Independent QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the QA Engineer. The certification report for the GCL shall, at a minimum, include the following:

- Daily reports prepared by the QA Engineer; and
- Daily construction progress reports clearly showing GCL placed by date.

### 4.8 Earthwork

As shown on drawing C-301 in "100% Specifications and Design Drawings," the soil materials used in the construction of this capping system consist of the following layers:

- Geocomposite drainage soil;
- Planting soil layers consisting of topsoil underlain by soil layers capable of support tree and shrub growth;
- Structural fill to be placed under roadways;
- Common borrow placed in select areas under roadways or to raise the subgrade to appropriate elevations.

The relevant quality control/quality assurance observations and specifications governing placement and testing of each layer are summarized in a separate Construction Quality Control Plan prepared by AmecFW.

## 5.0 CAP GEOSYNTHETICS QA REPORT

The QA Engineer in conjunction with the EOR and Contractor shall prepare a Cap Geosynthetic QA Report documenting work completed in this CQA Plan. This report shall contain at a minimum:

- As-built drawings from the Contractor;
- Conformed technical specifications from the EOR;
- Summary of DCB, submittals, and RFIs by the EOR;
- Reference to the QC data reported by the Contractor;
- Summary of QA/QC forms outlined in Appendix A prepared by the Independent QA Engineer and Contractor; and
- Photographic logs and QA/QC forms by the Independent QA Engineer.

| | | |
| | | |
| | | |
| | | |
| | | |
| | Total Linear Feet of Tie in to Existing | |
| | Total Linear Feet of Tie in Slope to Floor | |

The Quantities Listed Above Are Based On The Following :

- ☐ Field measurements
- ☐ Quantities are agreed to at this time
- ☐ Quantities listed include geosynthetics in anchor trench
- ☐ Job 100% complete
- ☐ Field change orders were Issued How Many? _____

**Check All Applicable Boxes Below:**

- ☐ Quantities listed include tie in / run out details
- ☐ Quantities to be verified by survey
- ☐ Quantities listed are per completed survey
- ☐ Job is partially complete.
- ☐ Anticipated remob date is: _____

☐ The project has been left, by ESI, in a clean and orderly fashion acceptable to customer.

_____
Initial by Customer / Rep

☐ All work has been found satisfactorily completed and the work satisfies the Project plans and specifications

# CERTIFICATE OF SUBGRADE SURFACE ACCEPTANCE

INSTALLER: ENVIRONMENTAL SPECIALTIES INTERNATIONAL, INC.

PROJECT NAME: _____ PROJECT NO: _____

LOCATION: _____

AREA ACCEPTED: _____

PANEL NUMBERS: _____

GRADE ACCEPTANCE: INSPECTOR: _____

GENERAL CONTRACTOR: _____

OWNER: _____

AUTHORIZED REPRESENTATIVE: _____

The undersigned, _____,certifies that he/she is a representative of Environmental Specialties International, Inc. authorized to execute this certificate, that he/she has visually inspected the subgrade surface described above on _____ and found the surface to be acceptable for installation of the geomembrane.

This certification is based on observation of the surface of the subgrade only. No subsurface inspections or test have been performed and Environmental Specialties International, Inc. makes no representations or warranties regarding conditions which may exist below the surface of the subgrade.

# Certificate of Completion

Sheet # 1

| | | | | | |
|---|---|---|---|---|---|
| Project Name | Honeywell SA-6 South | Material Desc. | LLDPE Geomembrane Cap | | |
| Project No. | 100530001 | Layer | **Primary** | Secondary | Tertiary |
| Owner/ Contr. | Honeywell / AmecFW | Type | Partial | Substantial | **Final** |
| QA Monitor | Langan | Date | 12/01/2015 | | |

Description and Area of Work Being Certified: Completion of capping of SA-6 South which included: placement of GVL/GCL, placement of LLDPE geomembrane, and placement of GDL. Material was placed in accordance with the Record Drawings and project specifications. To date, the geosynthetic components of SA-6 South are complete and summarized in the *QA Completion Report*.

I hereby certify that the above identified work has been inspected and it has been properly installed. I further certify all required testing has been completed and the results are acceptable to the CQA Officer. The liner system is suitable for its intended use.

1 This is the design elevation at Construction Control Grid Points.

2 Deviation = Surveyed Elevation - Design Elevation

Points in 0.1 - 0.5 ft. tolerance are due to a slight overcut in the top of slopes where it wouldn't be suitable for backfill due to compaction difficulties.

1 This is the design elevation at Construction Control Grid Points.

2 Deviation = Surveyed Elevation - Design Elevation

**Per SPECIFICATION 01460 SURVEY. SECTION 1.05 F. Spot Elevations - Survey shall be constructed to provide an accuracy of 0.1 feet vertically. Ninety percent of all spot elevations placed on the maps shall have an accuracy of at least 0.1', and the remaining 10 percent shall not be in error by more than one-half (1/2) the contour interval (0.5'). Break points added to replace Grid Points that fell on slopes and Boundary Points will be treated as Spot Elevations as defined in Section 1.05 F.**

**Maser Consulting P.A. certifies that the elevations, with their corresponding date obtained, of the Grid Points depicted in Table 1, Break Points in Table 2, Boundary Points in Table 3, and topographic spot elevations are correct, and representative of the as-built cap subgrade throughout the SA6 South cap.**

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/7/2015 |
| **PROJECT:** | SA-6 Capping | | **WEATHER:** | 75/85° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Soil Subgrade Inspection | **TIME:** | 0600 – 1400 |

| **CONTRACTOR & EQUIPMENT:** | **PERSONNEL ON SITE:** **Day #1** |
|---|---|
| **Thatcher Foundations**<br>*Equipment:* Dozer, Steel Drum Roller, Misc. Hand Tools (shovels, rakes) | **AmecFW**: Stu Bills, Dave Ambrose<br>**Langan:** Dan Bosworth, Jeff Stoicescu<br>**ENTACT**: Keith Goisse |

## ***Site Activities***

- Langan onsite to conduct soil subgrade inspection. Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area.
- Langan and ENTACT (two laborers) conducted visual inspection of the prepared soil subgrade. This area included the furthest western part of the cap (Sta. 24+00) to just east of Sta. 18+50.
- In general, the following soil subgrade properties were observed:
  - Some debris (wood fragments),small rocks, etc. were observed along the slopes and elevation changes from Sta. 24+00 to Sta. 18+50. It is recommended during the pull back and removal of the plastic tarp (in preparation for installation of liner), ENTACT should provide laborers with a wheelbarrow and equipment to collect various debris as it is encountered.
  - Along the slopes of the smaller swales, utility corridors, street channels, etc. some soft and loose material was noted. As recommended above, as the plastic is removed for liner installation activities, Entact should provide laborers to dress the slopes (i.e. remove any loose debris and conduct compaction (as required) with a hand tamper), as necessary.
- In addition to the general soil subgrade properties outlined above, some soft / wet areas (some with free standing water) were encountered. The location of these wet areas was in the general vicinity of the collection manhole (Sta. 21+00), where the soil subgrade was very soft (able to sink into the soil while walking). Langan conducted a site walk with AmecFW to collect GPS locations of these soft, underlying areas. The attached figure provides the swales, corridors, and trenches within vicinity of the collection manhole that do not meet the soil subgrade requirements. Additional grading / compaction activities will be required prior to liner installation within these areas.
  - Note: The locations on the attached figure do not represent every area that needs additional preparation activities. The general soil subgrade properties outlined above could represent varying locations as the entire soil area could not be observed due to the plastic being placed over the cap area. The locations outlined on the attached figure are meant to provide “critical” areas that may require more substantial work activities in order to have the subgrade properly prepared to the specifications.

Cc Jeff Stoicescu, Rory Johnston, Vikki Hon, File

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Observations Requiring Contractor / QA Engineer Review***

- Based on the soil subgrade inspection, the soil has not been approved for liner installation activities based on the wet / soft spots encountered (as outlined within this report). It is also recommended that laborers are provided when the plastic sheeting is removed so that the loose debris can be collected, and additional grading / compacting activities can be conducted (as required) along the slopes and contours.

***Action Items Pending***

- QA Engineer - Review SA-6 capping specifications and drawings. Review product submittals (as provided) and ensure that all data, drawings, and pertinent documents are ready for liner installation kickoff (planned for the week of 7/13).

***Action Items – Weekly Completions***

- None to Date

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Cap Installation Kickoff meeting scheduled for Thursday (7/9/15). At this time an additional soil subgrade inspection should be conducted with ESI representatives.

***Photograph Log***

Photo 1: Completed soil subgrade with plastic sheeting cover (looking west toward Sta. 24+00).

Photo 2: Entact conducting grading and compacting activities to the area east of Sta. 19+00.

***Photograph Log (continued)***

Photo 3: Graded and compacted soil subgrade near Sta. 24+00 (acceptable subgrade).

Photo 4: Miscellaenouos debris (wood, rocks, etc.) encountered. Debris removed from subgrade, however, while plastic sheeting is removed in prep for installation, additional observations shall be conducted to ensure all debris is removed prior to liner installation.

***Photograph Log (continued)***

Photo 5: Loose material and debris encountered along swale slope.

Photo 6: Standing water encountered along northern drainage swale / tree bulb.

***Photograph Log (continued)***

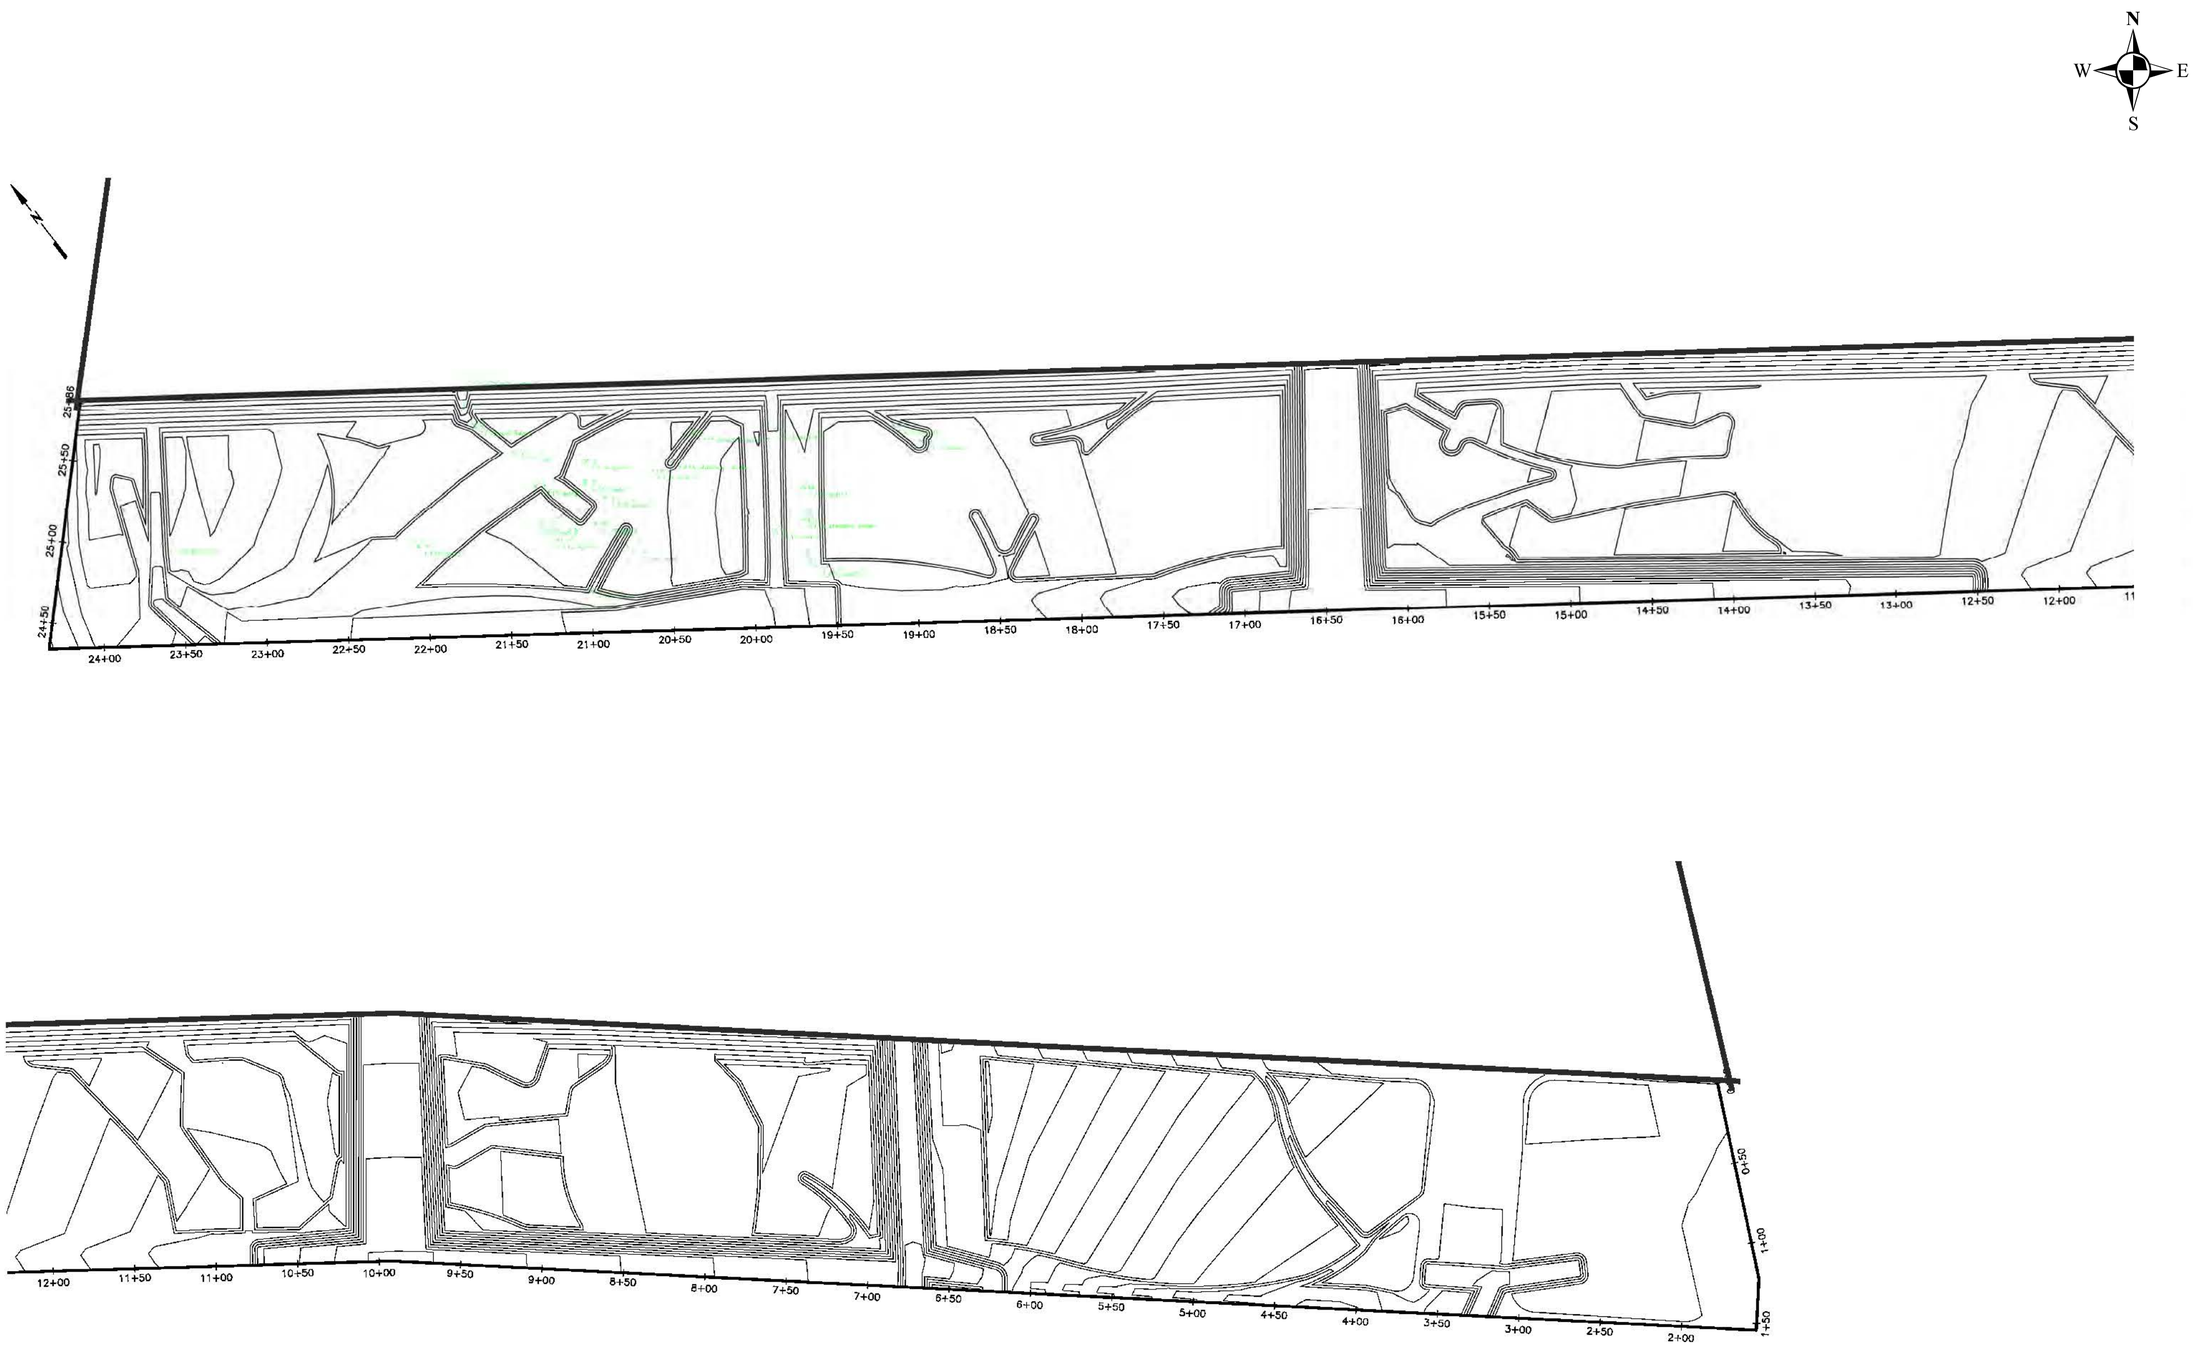

Photo 7: Standing water / soft area in vicinity of collection manhole (Sta. 21+00).

Photo 8: Soft / wet soil in vicinity of manhole. Indentations / footprints visible.

LANGAN

Notes:
1. Locations GPS surveyed by Langan and AMEC for soil subgrade areas requiring additional preparation activities prior to liner placement.
2. This Figure represents critical locations that were observed by the project team and does not include every area that may require additional preparation work. As the plastic sheeting is removed from the cap, ENTACT should provide sufficient manpower to remove potential miscellaneous debris, and re-grade / compact slopes, as required.
3. Subgrade observations collected on 7/7/15 and 7/13/15 by Langan field personnel and represent the areas between the western most boundary (Sta 24+00), and east of Sta17+50. The area to the east of Sta. 17+50 has not yet been observed.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/13/2015 |
| **PROJECT:** | SA-6 Capping | | **WEATHER:** | 80/90° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Soil Subgrade Inspection | **TIME:** | 0600 – 1100 |

| **CONTRACTOR & EQUIPMENT:** | **PERSONNEL ON SITE:** **Day #2** |
|---|---|
| **Thatcher Foundations**<br>*Equipment:* Dozers, Steel Drum Rollers, Misc. Hand Tools (shovels, rakes) | **AmecFW**:Stu Bills, Dave Ambrose, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT**: Keith Goisse |

## ***Site Activities***

- Langan onsite to conduct soil subgrade inspection, and to observe placement of first layer of geocomposite (gas venting layer) for SA-6 south capping. Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area.
- Based on subsequent conversations with the project team, no material was to be placed during the day (GDL or LLDPE) as the geomembrane was undergoing final conformance testing requirements and had not yet been delivered to the Site. As such, Langan and AmecFW conducted a visual inspection of the prepared soil subgrade. These areas included the locations previously identified during the Day #1 soil subgrade inspection, as well as additional areas completed since that date from Sta. 18+50 to Sta. 17+50, as shown in the attached Figure (Sheet 7).
- In general, the following soil subgrade properties were observed:
  - ENTACT had opened and dried the areas immediately west of the collection manhole. Additionally, ENTACT provided laborers to dress and repair the slopes, as required. Refer to Sheet 3 for example of slope that would require dressing. The additional areas east of the collection manhole will also be opened and dried, with additional preparation being completed, as required. Refer to Sheet 7 for areas that ENTACT has repaired soil to appropriate subgrade.
  - The slopes of the smaller swales, utility corridors, street channels, etc. some soft and loose material was noted. As the plastic is removed for liner installation activities, ENTACT should provide laborers to dress the slopes (i.e. remove any loose debris and conduct compaction (as required) with a hand tamper), as necessary.
- In addition to the general soil subgrade properties outlined above, some soft / wet areas (some with free standing water) were encountered east of the previously inspected areas. The coordinates of these locations were collected and are shown on Sheet 7. Additional grading / compaction activities will be required prior to liner installation within these areas.
  - Note: The locations on the attached figure do not represent every area that needs additional preparation activities. The general soil subgrade properties outlined above could represent varying locations as the entire soil area could not be observed due to the plastic being placed over the cap area.

Cc Jeff Stoicescu, Rory Johnston, Vikki Hon, File

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

The locations outlined on the attached figure are meant to provide "critical" areas that may require more substantial work activities in order to have the subgrade properly prepared to the specifications.

***Observations Requiring Contractor / QA Engineer Review***

- Based on the soil subgrade inspection conducted to date, it appears that the soil west of the collection manhole is acceptable to commence with installation activities. However, ENTACT shall provide laborers as the plastic is removed to conduct slope dressing and re-compaction (as required), as well as, to remove any unacceptable debris (i.e. rocks, misc. debris, etc.) from the subgrade. If further soil deterioration is encountered prior to the placement of the GDL and liner material, additional re-grading and re-compaction of the soil subgrade may be required. As such, the final soil subgrade inspection form will not be completed until immediately prior to GDL and liner placement.
- Based on the wet / soft spots encountered (as outlined within this report) east of the collection manhole, it appears that this soil subgrade is not suitable for liner installation activities. Additional preparation work (i.e. drying, re-compaction, etc.) is required prior to liner placement. It is also recommended that laborers are provided when the plastic sheeting is removed so that any loose debris can be collected, and additional grading / compacting activities can be conducted (as required) along the slopes and contours.

***Action Items Pending***

- QA Engineer - Review SA-6 capping specifications and drawings. Review product submittals (as provided) and ensure that all data, drawings, and pertinent documents are ready for liner installation kickoff (planned to commence on 7/15).

***Action Items – Weekly Completions***

- None to Date

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work will be conducted tomorrow (7/14) by ENTACT.
- Preparation and coordination to ensure that liner placement can begin on Wednesday (7/15).

***Photograph Log***

Photo 1: Example of washed slope that would require regarding and re-compaction activities.

Photo 2: Swale / root bulb with standing water and soft / wet bottom. Additional prep work required.

***Photograph Log (continued)***

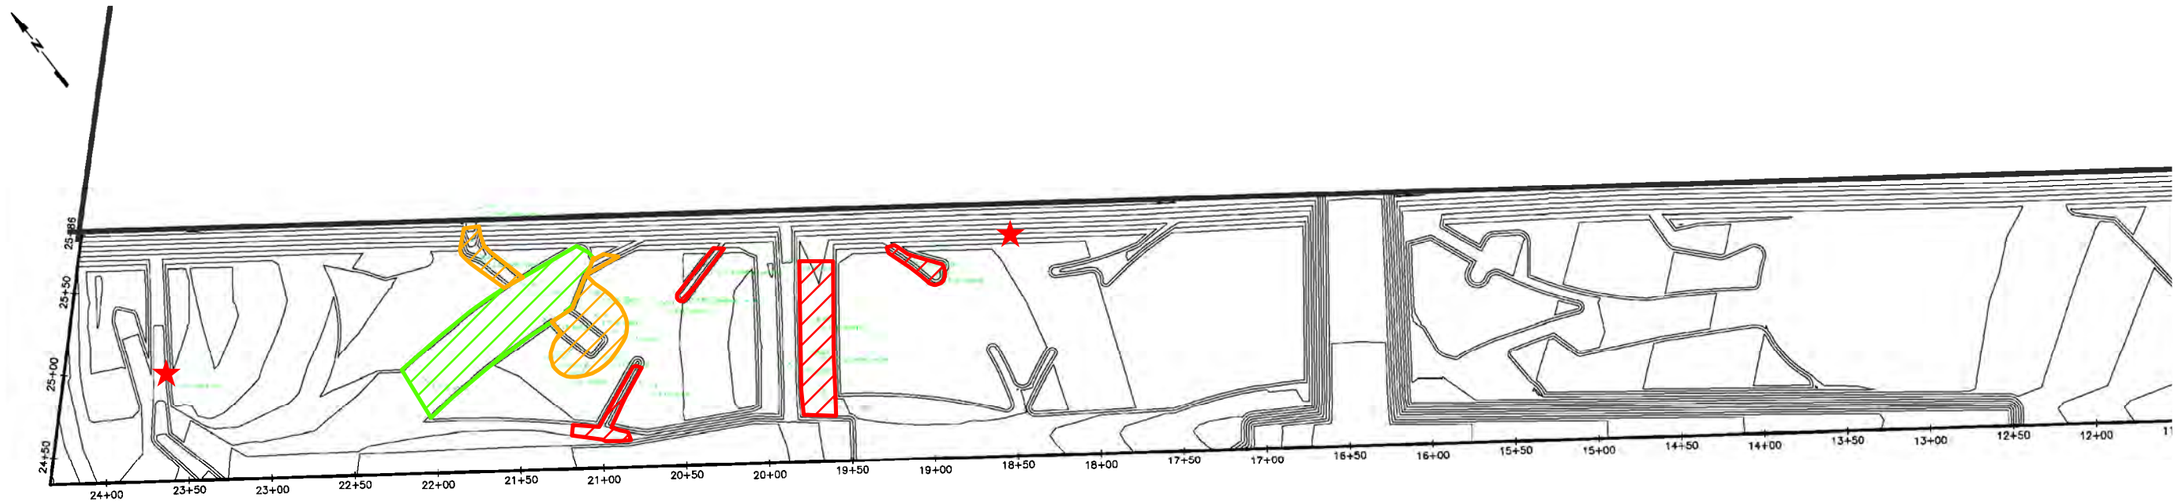
Photo 3: ENTACT dressing slopes west of collection manhole.

Photo 4: Area west of collection manhole. Opened and dried. ENTACT dressing slopes (as required).

***Photograph Log (continued)***

Photo 5: Wet area located east of collection manhole on top deck (still requires drying and re-compaction).

Photo 6: Dry area re-compacted west of collection manhole.



***Photograph Log (continued)***

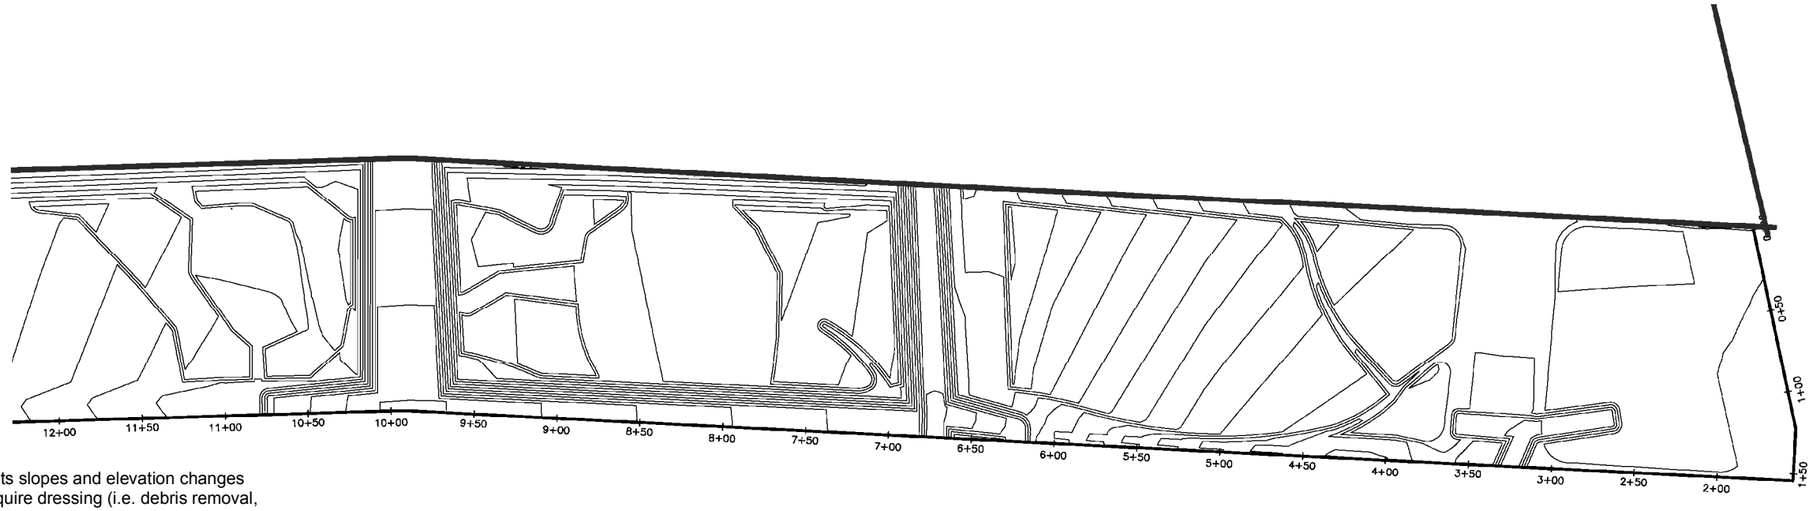


Photo 7: ENTACT filling and re-compacting depressions / voids in subgrade along southern edge of SA-6.

Photo 8: Grading and compacting soil east of collection manhole near Sta. 17+50.

## Legend

★ Respresents slopes and elevation changes that will require dressing (i.e. debris removal, re-compaction, etc.)

## Status

Represents areas that have been dried, regraded, and re-compacted. Soil appears acceptable for liner placement

Represents areas where ENTACT is presently drying and conducting regrading and re-compaction as required.

Represents areas that exhibit soft / wet subgrade. Soil not acceptable for liner placement.

Notes:
1. This Figure represents critical locations that were observed by the project team and does not include every area that may require additional preparation work. As the plastic sheeting is removed from the cap, ENTACT should provide sufficient manpower to remove potential miscellaneous debris, and re-grade / compact slopes, as required.
2. Subgrade observations collected on 7/7/15 and 7/13/15 by Langan field personnel and represent the areas between the western most boundary (Sta 24+00), and east of Sta17+50. The area to the east of Sta. 17+50 has not yet been observed.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/20/2015 |
| **PROJECT:** | SA-6 Capping | | **WEATHER:** | 80/90° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1900 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #3**<br>**AmecFW**:Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad<br>**Langan:** Dan Bosworth, Jeff Stoicescu<br>**ENTACT**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) starting at the west end of the SA-6 south. Material to be placed from the western end (west of Sta. 24+00, located at approximate Sta. 24+35) of SA-6 for approximately 100 ft. east to approximate Sta. 23+35.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area).
- Prior to placement of GVL or Cap, the plastic sheeting protecting the soil subgrade from the work area was removed. Final soil subgrade inspection was conducted for the area outlined above. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3, 4, and 5 of the daily photo log for 7/20/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the area of approximate Sta. 24+35 to Sta. 23+35 as outlined above.
- Upon soil subgrade approval, and prior to placement of the GVL and Liner, it was determined that an onsite meeting to discuss the revised panel layout and placement would be conducted between AmecFW, Langan, and ENTACT. During this meeting, the revised panel layout, seaming, soil subgrade approval, and other pertinent issues were discussed. Upon review of these topics, it was determined that ESI could begin with placement of GVL and Liner.
- ESI began by placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed on the western end of the Site (Sta. 24+35) moving east. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to 7/20/15 Photo Log for supporting photographs.
- After installation of GVL, geomembrane liner was installed beginning at the western end of the Site and moving east. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from Sta. 24+35 to approximate Sta. 23+35. A total of four panels were installed (P-1, P-2,

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

P-3, and P-4), with seams overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing. The results of the pre-trial weld are provided in the associated QA form submitted for today (7/20), *Trial Weld Log.*

- Upon installation and welding of the geomembrane panels, based on required working permit hours, it was determined that non-destructive testing, and liner repair work would be conducted on 7/21/15. A destructive sample (DS-1) was collected, however, this sample was not shipped on 7/20/15 due to the extended working hours. Sample to be recorded on the *Destruct Log* and shipped on 7/21/15.

## ***Non-Conformance Items / Corrective Actions***

- None Encountered.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log. Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, etc.)
- Review laboratory results for destruct sample DS-1.

## ***Action Items – Weekly Completions***

- None to Date

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 23+35 to Sta. 22+35).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/21/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 83/95° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1630 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #4**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) continuing from western end of SA-6 South. Material to be placed from Panel #4 (P-4) installed on 7/20/15 (located at approximate Sta. 23+25) running approximately 100 ft. east (Sta. 22+35).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting non-destructive testing and patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/20/15 (Panels 1-4). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed with the project specifications (refer to *Preweld Test Report* for 7/21/15 for results).
- A total of eight repairs (RP-1 through RP-8) were observed and fixed (according to the project specifications) from Panel #1 through Panel #4. The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted, as outlined in the project specifications.
- Some non-conformance issues were observed, outside of the "custom fit" repairs noted above (refer to *Notice of Non-Compliance and Corrective Action* forms), and were documented on Sheet #1 and Sheet #2 as non-compliance. These issues were also recorded within the *Repair Log* as a subgrade irregularity and are identified as RP-3 and RP-8. The non-compliance issues encountered were identified based on debris / rocks that were observed underneath the geomembrane cap. The rocks were removed from these areas and the hole was patched / repaired according to the project specifications and further outlined in the *Non-Compliance and Corrective Action* forms – *Sheet #1* and *Sheet #2* for 7/21/15.
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/20/15, Entact removed the plastic sheeting protecting the soil subgrade for the next 100 ft. section of work area (approximate Sta. 23+35 to Sta. 22+35). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/21/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to *Photos #9 & 10* of the daily photo log for 7/21/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 23+35 to Sta. 22+35 as outlined above.

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 23+35 (east of P-4) moving east (for approximately 100 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *7/21/15 Photo Log* for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #4 (located at approximate Sta. 23+35) on 7/20/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 23+35 to Sta. 22+35. A total of four panel lengths were installed (P-5, P-6, P-7, P-8, P-9) by ESI. Note: Encountered the end of the geomembrane roll while placing Panel #6 (P-6). Butt seam required between P-6 and P-7. A destructive test sample (DS-2) was also collected from this seam (one sample for ESI, and one sample for Langan). The results of trial welding test for the destructive sample are outlined in the *Preweld Test Report* for 7/21/15. A total of ten 1-inch specimens were collected for peel and shear strength testing (5 tests for each).
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/20), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted patch / repair work and non-destructive testing on Panels 5-9 (as outlined in the project specifications). During the non-destructive testing conducted between Panel 7 (P-7) and Panel 8 (P-8), the non-destruct test failed and a non-compliance issue was noted. Since P-7 only extended approximately 6 ft. (north to south), the entire seam would be patched and repaired (according to the project specifications) on 7/22/15.
- It should also be noted that pipe booting activities were conducted on piezometer PZ20 and well 073-MW-1BR as outlined in the project specifications. These two penetrations were sealed with geomembrane according to the project specifications. However, the final clamps with gasket have not yet been installed. The *Gas Vent and Piezometer Penetrations* Form will be filled and out and confirmed by Langan and ESI once these activities are completed.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 1 (Sheet #1) – Subgrade irregularity identified as RP-3 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #2). Stone was subsequently removed, and hole was patched/repaired following project specs and further defined in *Sheet 1 Notice of Non-Compliance*
- Non-Conformance No. 2 (Sheet #2) – Subgrade irregularity identified as RP-8 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #2). Stone was subsequently removed and hole was patched/repaired following project specs and further defined in *Sheet 2 Notice of Non-Compliance.*

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Non-Conformance No. 3 (Proposed Sheet #3) – Failed seam
    - During non-destruct testing of P-7 and P-8 (6 ft. run north to south), the test failed as pressure could not be held within 4 psi (as outlined in project specifications). ESI will patch and repair the entire 6 ft. seam length (according to project specs) and this non-compliance issue will be documented on 7/22/15 and issued a repair number.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/21/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.)
- Review laboratory results for destruct sample DS-2. Note: QA destruct sample also collected (DS-2) by Langan.

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Reviewed laboratory destruct sample results for samples DS-1. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 22+35 to Sta. 21+35).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

## ***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 7/21/15 |
| A3 – Photo Log | Pages 1 – 9 | Total of 18 photos outlining pertinent daily observations and descriptions |
| A4 – Geosynthetic Inventory Log | Sheet 1 | Completed to date |
| A5 – Subgrade Approval | Sheet 2 & ESI (7/21/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |

**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #9 (P-9) installed on 7/21/15 (located at approximate Sta. 22+35) running approximately 95 ft. east to Sta. 21+40.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting non-destructive testing and patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/21/15 (Panels 5-9). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed with the project specifications (refer to *Preweld Test Report* for 7/22/15 for results. Extrusion testing identified with as EXT on form).
- A total of six repairs (RP-9 through RP-14) were observed and fixed (according to the project specifications) from Panel #5 through Panel #9. The majority of these repairs were associated with piezometer pipe boots and repairs for the destructive samples collected. These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- One non-conformance issue was observed, outside of the repairs noted above (refer to *Notice of Non-Compliance and Corrective Action* forms), and was documented on Sheet #3 as non-compliance. This issue was also recorded within the Repair Log as a failed seam test (non-destruct test) and identified as RP-13.
- The non-compliance issue encountered was a failed non-destructive seam test conducted between Panels 7/8. The failed seam was along the southern end of SA-6 and was only 6 ft. in total length (butt end of seam as outlined in the 7/21/15 report). As such, the seam was patched according to the project specifications and further outlined in the *Non-Compliance and Corrective Action* forms – Sheet #3 for 7/21/15.

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Upon completion of the cap detailing, ESI began to install GDL panels beginning at the western end of the Site (Sta. 24+35) and moving east. The GDL panels were installed over the geomembrane cap previously placed on 7/20/15, and were installed to just before the first destructive sample collected (DS-1) along Panels 3/4.
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/21/15 and installing GDL, Entact removed the plastic sheeting protecting the soil subgrade for the next 95 ft. section of work area (approximate Sta. 22+35 to Sta. 21+40). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/22/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #2 & 3 of the daily photo log for 7/22/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 22+35 to Sta. 21+40 as outlined above.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 22+35 (east of P-9) moving east (for approximately 95 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to 7/22/15 Photo Log for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #9 (located at approximate Sta. 22+35) on 7/21/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 22+35 to Sta. 21+40. A total of four panel lengths were installed (P-10, P-11, P-12, and P-13) by ESI.
- A destructive test sample (DS-3) was collected from the Panel 10/11 seam, within the 500 ft. linear foot requirement outlined in the project specifications. The results of trial welding test for the destructive sample are outlined in the *Preweld Test Report* for 7/22/15. A total of ten 1-inch specimens were collected for peel and shear strength testing (5 tests for each).
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/22), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted patch / repair work and non-destructive testing on Panels 10-13 (as outlined in the project specifications). The patches associated with Panels 10-13 will be completed with extrusion welds on 7/23/15.
- It should also be noted that pipe booting activities were conducted well 115-W3-SO (located on Panel #8, northern slope) as outlined in the project specifications. The penetration was sealed with geomembrane according to the project specifications. However, the final clamps with gasket have not yet been installed. The *Gas Vent and Piezometer Penetrations* Form will be filled and out and confirmed by Langan and ESI once these activities are completed. Additionally, a gas vent pipe (GV-7) was covered with geomembrane, and will be cut, sealed, and booted according to the specifications at a future date.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 3 (Sheet #3) – Failed seam, identified as RP-13 on *Repair Log*
    - During non-destruct testing of P-7 and P-8 (6 ft. run north to south), the test failed as pressure could not be held within 4 psi (as outlined in project specifications). This area was patched and repaired along the entire 6 ft. seam length (according to project specs) as outlined on *Sheet #3*

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

*Notice of Non-Compliance*.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/22/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/21/15.
- Review laboratory results for Destruct Sample (DS-3)

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/21/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Destructive Sample Summary,* and *Certificate of Subgrade Acceptance* forms. Additional review of Preweld Test Report, Seam Control Form, and Repair Report required prior to acceptance.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-2, as well as Langan QA sample (DS-2). Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 21+40 to Sta. 20+40).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/23/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 70/82° F, Clear, Sunny, Wind |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1630 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #6**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #13 (P-13) installed on 7/22/15 (located at approximate Sta. 21+40) running approximately 150 ft. east to Sta. 19+90.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI deploying GDL along the western end of the cap. Based on the minor repairs required from the geomembrane placement on 7/22/15, it was determined that extrusion weld repairs would be conducted tomorrow (7/24/15).
- A total of 11 rolls (7 north to south runs over SA-6; approximately 165 ft.) of GDL were deployed along the western end of SA-6. GDL was installed to cover the geomembrane panels placed on 7/20/15 and 7/21/15 (GLD installed up to P-9). Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and geotextile seams sewn along the geotextile for adjacent panels.
- While ESI was and installing GDL along the western end of SA-6, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 150 ft. section of work area (approximate Sta. 21+40 to Sta. 19+90). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/23/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3,4,5, and 6 of the daily photo log for 7/23/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 21+40 to Sta. 19+90 as outlined above.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After geotextile was placed, GVL was installed from approximate Sta. 21+40 (east of P-13) moving east (for approximately 150 ft.) to Sta. 19+90. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewn along the seams (according to the project specifications). Refer to 7/23/15 Photo Log for supporting photographs.

- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #13 (located at approximate Sta. 21+40) on 7/22/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 21+40 to Sta. 19+90. A total of five panel lengths were installed (P-14, P-15, P-16, P-17 and P-18) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/23), *Trial Weld Log.*
- As outlined above, no extrusion welding and detailing activities were conducted by ESI. These activities are scheduled to be completed tomorrow (7/24) for the repairs associated with geomembrane capping from 7/22/15 and 7/23/15. It should also be noted that two destructive fusion weld samples will be collected on 7/24/15 from Panels 14-18. An extrusion weld sample will also be required once detailing activities commence in the morning.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items to be recorded from 7/23/15 as no repair work was completed.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/23/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/21/15 and 7/22/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- ESI – complete repair / patch work and collect appropriate destruct samples for fusion and extrusion welding (as outlined in project specifications.

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, as well as reviewed and approved ESI submitted forms.
- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/21/15 and 7/22/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Destructive Sample Summary,* and *Certificate of Subgrade Acceptance* forms. Additional review of Preweld Test Report, Seam Control Form, and Repair Report required prior to acceptance.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-3. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 19+90 to Sta. 19+00).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/24/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 75/90° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1700 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #7**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #18 (P-18) installed on 7/23/15 (located at approximate Sta. 20+25) running approximately 90 ft. east to Sta. 19+00. Note: Soil subgrade approved to approximate Sta. 19+90 on 7/23/15. Geomembrane cap only installed to approximate Sta. 20+25 by ESI (additional 35 ft. of approved subgrade in addition to 90 ft. approved on 7/24/15).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/23/15 (Panels 14-18). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/24/15 for results (extrusion testing identified as EXT. on form).
- A total of seventeen repairs (RP-15 through RP-31) were observed and fixed (according to the project specifications) from Panel #9 through Panel #18 (repair / detailing work conducted on panels installed from 7/22/15 and 7/23/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications. Some additional repairs (including “custom fit” cuts to conform the geomembrane) required, however, these repairs will be completed on Monday (7/27) to allow ESI to continue to place geomembrane to the east.
- One extrusion weld destruct sample (DSX-1) was collected from Panel #13 (located on RP-17). Extrusion weld destruct samples collected every 500 lf. of welding (as outlined in project specs).
- One non-conformance issue was observed, outside of the repairs noted above (refer to *Notice of Non-Compliance and Corrective Action* forms), and was documented on Sheet #4 as non-compliance. This issue was also recorded within the Repair Log as a subgrade irregularity and was noted and repaired (RP-30) following the project specifications.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- While ESI was conducting cap detailing for the geomembrane cap placed on 7/22/15 and 7/23/15, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 90 ft. section of work area (approximate Sta. 19+90 to Sta. 19+00). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/24/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #8 & 9 of the daily photo log for 7/24/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 19+90 to Sta. 19+00 as outlined above.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 20+25 (east of P-18) moving east (for approximately 135 ft. total [35 ft. remaining from 7/23/15 + 90 ft. approved on 7/24]). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Along the slopes and elevation changes, additional fasteners were placed along the geonet to provide additional support within these sloped areas. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to 7/24/15 Photo Log for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #18 (located at approximate Sta. 20+25) on 7/23/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 20+25 to Sta. 19+00. A total of six panel lengths were installed (P-19, P-20, P-21, P-22, P-23, P-24) by ESI.
- Two destructive test samples (DS-4 & DS-5) were collected from the Panel 14/15 and 17/18 seam, within the 500 ft. linear foot requirement outlined in the project specifications. The results of the trial welding tests for the destructive samples are outlined in the *Preweld Test Report* for 7/24/15. A total of ten 1-inch specimens were collected for peel and shear strength testing (5 tests for each) for each sample.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/24), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted non-destructive testing on Panels 19-24 (as outlined in the project specifications). No patch / repair work on the installed panels was conducted. Patches associated with Panels 19-24 will be completed with extrusion welds and vacuum box testing on Monday (7/27/15). Additionally, some additional patchwork for the panels installed on 7/23/15 will also be completed, as outlined above.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 4 (Sheet #4) – Subgrade irregularity identified as RP-30 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #17). Stone was subsequently removed, and hole was patched/repaired following project specs and further defined in *Sheet 4 Notice of Non-Compliance*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/24/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/23/15 forms.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Review laboratory test results for destruct samples DS-4 and DS-5 (fusion) and DSX-1 (extrusion). Note: QA sample (DSX-1) also collected by Langan.

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/23/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Destructive Sample Summary,* and *Certificate of Subgrade Acceptance* forms. Submittal of additional forms from 7/23/15 and review of Seam Control Form, required prior to acceptance.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-3. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 19+00 to Sta. 18+00).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

## ***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 7/24/15 |
| A3 – Photo Log | Pages 1 – 9 | Total of 18 photos outlining pertinent daily observations and descriptions for 7/24/15 |
| A4 – Geosynthetic Inventory Log | Sheet 1 | Completed to date |
| A5 – Subgrade Approval | Sheet 5 & ESI (7/24/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |
| A6 – Trial Weld Log | Page 1 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 7/24/15. |
| A7 – Panel Placement Log | Page 5 | One panel placement log provided by ESI and confirmed by Langan for geomembrane placed on 7/24/15 |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/27/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 80/90° F, Hazy, Light Rain |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1645 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #8**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #24 (P-24) installed on 7/24/15 (located at approximate Sta. 19+00) running approximately 100 ft. east to Sta. 18+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI deploying GDL along the western end of the cap. GDL was placed to approximate Sta. 21+00 (near collection manhole) which included the placement of 9 rolls (14 different panels) of GDL from P-9 (geomembrane installed on 7/21/15) to P-14 (geomembrane installed up to 7/23/15). Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and sewing of the geotextile completed for adjacent geocomposite panels.
- While ESI was and installing GDL along the western end of SA-6, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 80 ft. section of work area (approximate Sta. 19+00 to Sta. 18+20). Based on visual inspection of the soil, two areas were identified that did not meet the subgrade requirements.
    - The drainage swale located along Sta. 19+00 at Break Point 675-18.54 collected rainwater from storms on 7/26/15. As such the area was soft / wet and did not meet the subgrade requirements. The installed geomembrane and GVL (from 7/24/15) was pulled back and this area was left open to dry. Refer to Photo #2 of 7/27/15 Photo Log.
    - An additional location was identified to the southern end of the SA-6 cap near approximate Bound Point 655-15.58. The 16 oz. geotextile was pulled back from this area and the soil subgrade was allowed to dry. Refer to Photo 3 of 7/27/15 Photo Log.
- Based on the information outlined above, no soil subgrade was approved for GVL and geocomposite placement, as the soil did not conform with the project specifications. As such, no soil subgrade approval forms were completed for 7/27/15.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- With no subgrade approval for additional panel placement (no panel layout forms completed for 7/27/15), ESI conducted patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/23/15 and 7/24/15 (Panels 19-24). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/27/15 for results (extrusion testing identified as EXT. on form).
- A total of twenty-one repairs (RP-31 through RP-51) were observed and fixed (according to the project specifications) from Panels #18 through Panel #24 (repair / detailing work conducted on panels installed from 7/23/15 and 7/24/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications. Note: No non-compliance issues were observed as patch / repair work conducted consisted primarily of custom fit repairs to allow geomembrane to conform to SA-6 contours.
- A total of three non-destructive samples were collected for lab testing (as outlined in the project specs). Two fusion weld samples DS-6 (panel seams 20/21) and DS-7 (Panel seams 23/24), along with one extrusion weld sample DSX-2 (south end of SA-6 on P-15) were collected within the 500 linear foot specification requirements.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as no new geomembrane panels were placed and the repairs associated with 7/27/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/23/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/21/15 and 7/22/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Review laboratory test results for destruct samples DS-6 and DS-7 (fusion) and sample DSX-2 (extrusion).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-5 (fusion) and destruct sample DSX-1 (extrusion). Note: QA sample (DSX-1) also reviewed and in compliance with project specs. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 19+00 to Sta. 18+00) to ensure soil subgrade complies with project specs.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 7/27/15 |
| A3 – Photo Log | Pages 1 – 6 | Total of 12 photos outlining pertinent daily observations and descriptions |
| A4 – Geosynthetic Inventory Log | | N / A – no updates for 7/27/15 |
| A5 – Subgrade Approval | | N / A – no subgrade approval for 7/27/15 |
| A6 – Trial Weld Log | Page 1 | One trial weld log provided by ESI and confirmed by Langan for pre and destruct welds completed up to 7/27/15. |
| A7 – Panel Placement Log | | N / A no panels placed on 7/27/15 |
| A8 – Destruct Seam Testing COC | Sheet 1 | Updated with samples from 7/27/15 |
| A9 – Seam/Non-Destruct. Test Log | | N / A no non-destruct tests conducted on 7/27/15 |
| A10 – Repair Log | Pages 2-3 | One repair report provided by ESI and confirmed by Langan for repairs conducted on 7/27/15. |
| A11 – Conformance COC | | N / A for 7/27/15 |
| A12 – Destructive Seam Field Test | Page 1 | One destructive sample information form provided by ESI and confirmed by Langan for destruct samples collected on 7/27/15. |
| A13 – Destruct. Sample Summary | Sheet 1 | Updated with sample information from 7/27/15 |
| A14 – Penetration & Edge Form | | N / A to be completed once clamps for pipe boots are installed. |
| A16 – Notice of Non-Compliance | | No non-compliance issues identified as no new panels were installed |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/28/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 78/92° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1645 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #9**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #24 (P-24) installed on 7/24/15 (located at approximate Sta. 19+00) running approximately 80 ft. east to Sta. 18+20. Note: No geomembrane placed on 7/27/15, as soil subgrade was not approved for two wet / soft areas identified at approx. Sta. 19+00 (further described in 7/27/15 report).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI finishing patch / repair work (cap detailing) and vacuum box testing for the geomembrane cap that was installed on 7/24/15 (Panels 19-24). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/28/15 for results (extrusion testing identified as EXT. on form).
- A total of thirty-six repairs (RP-52 through RP-87) were observed and fixed (according to the project specifications) from Panel #19 through Panel #24 (repair / detailing work conducted on panels installed on 7/24/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/24/15, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 100 ft. section of work area (approximate Sta. 19+00 to Sta. 18+00). The previously identified wet / soft areas along Sta. 19+00 were dried, graded, and compacted according to the project specs. Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/28/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3,4,5 of the daily photo log for 7/28/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

The soil subgrade inspection sheet was submitted for the approximate area of Sta. 19+00 to Sta. 17+80 (west of utility corridor).

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 19+00 (east of P-24) moving east (for approximately 80 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *7/28/15 Photo Log* for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #24 (located at approximate Sta. 19+00) on 7/24/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 19+00 to Sta. 18+20. An additional approximately 40 ft. section of subgrade was approved from approximate Sta. 18+20 to Sta. 17+80 to allow ESI to place an additional two panels to the east. A total of six panel lengths were installed (P-25, P-26, P-27, P-28, P-29, P-30) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/28), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted non-destructive testing on Panels 25-30 (as outlined in the project specifications). Additionally, one extrusion weld sample (DSX-3) was collected (as per project specifications) from RP-82 and sent to the approved laboratory for analysis. No patch / repair work on the installed panels was conducted. Patches associated with Panels 25-30 will be completed with extrusion welds and vacuum box testing on Wednesday (7/29/15). Additionally, two destruct samples for the fusion welding will be collected (as required by the project specs) on 7/29/15.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 7/28/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/28/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Repair Report identified on 7/27/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Review laboratory test results for destruct sample DSX-3 (extrusion).

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15, 7/24/15, and 7/27/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-7 (fusion) and destruct sample DSX-1 through DSX-2 (extrusion). Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work for the next approximate 80 ft. run east (approximately from Sta. 17+80 to Sta. 17+00) through utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #30 (P-30) installed on 7/28/15 (located at approximate Sta. 17+80) running approximately 80 ft. east to Sta. 17+00 (up to 1st utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI finishing patch / repair work (cap detailing) and vacuum box testing for the geomembrane cap that was installed on 7/28/15 (Panels 25-30). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/29/15 for results (extrusion testing identified as EXT. on form).
- A total of forty-two repairs (RP-88 through RP-129) were observed and fixed (according to the project specifications) from Panel #25 through Panel #30 (repair / detailing work conducted on panels installed on 7/28/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- Additionally, pipe boots were completed (with seals and clamps) for PZ-20, 073-MW-1BR, 115-W3-SO, and GV-7, however, the final butyl seal around the top of the boot is required prior to completion of the *Pipe Boot and Penetration Logs.*
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/28/15, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 80 ft. section of work area (approximate Sta. 17+80 to Sta. 17+00). Prior to soil approval, the area was spot checked for survey elevations and was approved as acceptable and within the grading requirements. Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/29/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material.

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

Refer to Photos #5 and 8 of the daily photo log for 7/29/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 17+80 to Sta. 17+00 (up to 1st utility corridor).

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 17+80 (east of P-30) moving east (for approximately 80 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *7/29/15 Photo Log* for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #30 (located at approximate Sta. 17+80) on 7/28/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 17+80 to Sta. 17+00. A total of four panel lengths were installed (P-31, P-32, P-33, P-34) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/29), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted non-destructive testing on Panels 31-34 (as outlined in the project specifications). Additionally, three non-destruct samples were collected (DS-8, DS-9, and DSX-4). DS-8 was collected from Panel 26/27, DS-9 from Panel 29/30, and DSX-4 (extrusion weld) was collected from Panel #27 (RP-102).

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 7/29/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/29/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Repair Report and Seam Control identified on 7/28/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Review laboratory test results for destruct sample DS-8 and DS-9 (fusion), along with DSX-4 (extrusion).

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15, 7/24/15, and 7/27/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Completed Langan Daily Report, Photo Log, and Soil Subgrade Approval Form for 7/28/15. Revisions for Repair Report and Seam Control Form required prior to sign-off.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-7 (fusion) and destruct sample DSX-1 through DSX-3 (extrusion). Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work for the next approximate 80 ft. run east (approximately from Sta. 17+80 to Sta. 17+00) through utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/30/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 76/85° F, Overcast, PM T-Storms |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1500 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #11**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL), and geocomposite clay liner (GVL), continuing from western end of SA-6 South. Material to be placed from Panel #34 (P-34) installed on 7/29/15 (located at approximate Sta. 17+00) through 1st utility corridor located at approximate Sta. 16+50.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/29/15 (Panels 31-34). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/30/15 for results (extrusion testing identified as EXT. on form).
- A total of fifteen repairs (RP-130 through RP-144) were observed and fixed (according to the project specifications) from Panels #31 through Panel #34 (repair / detailing work conducted on panels installed from 7/29/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), and also to remove wrinkles observed around changes in elevation. These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- As outlined above, no non-conformance issues were observed during repair/patch work conducted on 7/30/15, as repairs were associated with conforming the geomembrane to the SA-6 contours.
- Based on the expected weather forecast of early afternoon thunderstorms, it was determined that no GCL would be placed within the utility corridor. As such, no soil subgrade was approved for GCL placement and no panel placement forms were completed.
- ESI instead deployed GDL along the western end of the cap. GDL was placed to approximate Sta. 20+00 which included the placement of 12 rolls (rolls from north to south of SA-6; 17 different panel numbers with butt seams) of GDL from P-14 to P-21. GDL Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and sewing of the geotextile completed for adjacent geocomposite panels (with orange fabric obtained from extra roll of GDL).

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- In addition to GDL placement, Entact began to build an access ramp toward the western end of the SA-6 cap to bring in protective cover soil for placement over GDL. Prior to ramp construction, approved caution tape (as outlined in the project specs was placed at a maximum 55-inch distance on top of the GDL prior to protective cover soil being spread.
- A total of one non-destructive sample (DS-10) was collected for lab testing (as outlined in the project specs). DS-10 was comprised of a fusion weld sample from Panels 32/33.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 7/30/15 consisted of custom fit design or wrinkle removal to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/30/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 1 gas vent).
- Review laboratory destruct samples (peel and shear) for DS-10 and DSX-4

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-9, and DSX-1 through DSX-3. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 17+00 to Sta. 16+00) through the 1st utility corridor.
- Begin placement of GCL along 1st utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 73/88° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1700 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #12**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## *Site Activities*

- Langan onsite for observation of placement of geocomposite drainage layer (GDL), continuing from western end of SA-6 South. Material to be placed from Panel #21 (P-21) to approximate Panel #33 (P-33). Based on the PM thunderstorms from 7/30/15, soil subgrade through the utility corridor could not be approved due to soft / wet areas identified. As such, ESI prepped to deploy GDL over the installed geomembrane areas.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI filling sand bags for GVL / geomembrane placement.
- While ESI was filling sandbags, Langan, AmecFW, and Entact conducted a review of the as-built panel layout to confirm repairs and associated panel locations. Once this information was confirmed, ESI began to deploy GDL over the installed geomembrane.
- ESI deployed GDL along the western end of the cap. GDL was placed from approximate Sta. 20+00 (approx. P-21 location) to approx. Sta. 17+00 (approx. P-33 location) which included the placement of 21 rolls (rolls from north to south of SA-6; 28 different panel numbers with butt seams) of GDL from P-21 to P-33. GDL Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and sewing of the geotextile completed for adjacent geocomposite panels (with orange fabric obtained from extra roll of GDL).
- No geomembrane patch / repair work was conducted as part of the 7/31/15 daily activities. Similarly, no new panels were installed as soil subgrade was not approved.

## *Non-Conformance Items / Corrective Actions*

- No non-conformance items observed for work activities completed on 7/31/15. No geomembrane panels installed, and no patch / repair work or sampling was conducted.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/31/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 1 gas vent).

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-10, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work to remove soft / wet areas for the next 100 ft. run east (approximately from Sta. 17+00 to Sta. 16+00) through the 1st utility corridor.
- Begin placement of GCL along 1st utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 73/88° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1945 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #13**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #34 (P-34) installed on 7/29/15 (located at approximate Sta. 17+00) running through first utility corridor approximately 120 ft. east to Sta. 15+80 (to eastern end of 1st utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI placing an additional two panels of GDL (moving east from Panel #33) to cover up to geomembrane Panel #34 (P-34). While GDL was being placed, Langan and Entact conducted soil subgrade approval from approximate Sta. 17+00 to Sta. 15+80 (through 1st utility corridor). Refer to *Soil Subgrade Approval* forms from 8/3/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #1,2, and 3 of the daily photo log for 8/3/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 17+00 to Sta. 15+80 (to eastern side of 1st utility corridor).
- Geocomposite clay liner (GCL), GVL and Cap placement began with ESI placing the GCL along the bottom and slopes of the utility corridor (shown in the *8/3/15 Photo Log*) as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with a granular bentonite. Note: Prior to GCL placement, a soil transition slope (approx. 2 ft. by 2 ft. was constructed along the northern slope of the utility corridor to allow the GCL to transition over the slope without having to conform to the 90 deg. turns of the SCB wall). This soil slope modification was approved prior to construction.
- In addition to the GCL (placed within the utility corridor), 16 oz. geotextile was placed along the boundaries of the SA-6 South Cap (located at the areas above the groundwater table and outside of the GCL) over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/3/15 Photo Log* for supporting photographs.

- After installation of GCL and GVL through the utility corridor, geomembrane cap was installed continuing east of previously installed Panel #34 (located at approximate Sta. 17+00) on 7/29/15. Panels were oriented from east to west through the utility corridor (as proposed in the approved Panel Layout) and were installed through the utility corridor (located at approx. Sta. 16+50) running from the top of the western slope to the top of the eastern slope. Additional panels were installed outside of the utility corridor and were T (butt seamed) into the east-west panels from inside the utility corridor (the panels outside of the utility corridor reverted back to the north-south orientation as indicated on the approved panel layout). A total of twelve panel lengths (different dimensions and sizes) were installed (P-35, P-36, P-37, P-38, P-39, P-40, P-41, P-42, P-43, P-44, P-45, and P-46) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/3), *Trial Weld Log.*
- Installation and welding of the geomembrane panels was conducted until approximately 8 pm to ensure that the utility corridor was properly covered and sealed due to expected overnight storms. As such, no non-destructive testing on the installed panels was conducted. Additionally, no patch / repair work was completed, and no destructive samples were collected. These activities will be completed tomorrow (8/4/15).

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as no patch / repair work was conducted on geomembrane cap.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/3/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-10, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 15+80 to Sta. 14+80) east of utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/4/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 70/85° F, AM Rain, Clear |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1630 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #14**<br>**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from east of Panel #42 installed on 8/3/15 (located at approx. Sta. 15+80) moving east approximately 100 ft. to approximate Sta. 14+80.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Based on the AM storms / rain, ESI could not conduct patch / repair work (i.e. extrusion welding) on the geomembrane panels installed on 8/3/15 due to the inclement weather. Observation of the next section of soil subgrade (approx. Sta. 15+80 to 14+80) was conducted and soft / wet areas were identified with ponding water (due to the storms). As such, soil subgrade was not approved for additional panel placement. Refer to *8/4/15 Photo Log* for subgrade photos. ESI offsite until 12 PM for weather to clear.
- Entact removed the protective plastic layer covering the soil subgrade and conducted drying activities, re-grading, and re-compaction of the soil (as required).
- ESI back onsite at approximately 12 PM to conduct patch / repair work for the panels installed on 8/3/15 (Panels 35-46). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 8/4/15 for results (extrusion testing identified as EXT. on form).
- A total of forty-one repairs (RP-145 through RP-185) were observed and fixed (according to the project specifications) from Panel #35 through Panel #46 (repair / detailing work conducted on panels installed on 8/3/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), as well as seam joint repairs where non-destructive testing was conducted along the panel seams. These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- No non-conformance issues were noted as repairs consisted of custom fit design or routine patch / repair work to allow geomembrane to conform to SA-6 contours.

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- A total of two destruct samples, DS-11 and DS-12 (fusion weld samples) were collected for laboratory analysis. DS-11 was collected from panel seam 36/37 and DS-12 was collected from panel seam 42/43

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 8/4/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/4/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).
- Review laboratory results for DS-11 and DS-12

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-10, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work to remove soft / wet areas for the next 80 ft. run east (approximately from Sta. 15+80 to Sta. 15+00) of 1st utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/5/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 70/84° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1700 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #15**<br>**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #42 (P-42) installed on 8/3/15 (located at approximate Sta. 15+80) running approximately 70 ft. east to Sta. 15+10.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work for three wrinkles (refer to *Repair Log* 8/5/15) that were identified along Panels 35-46 which were placed on 8/3/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/5/15).
- A total of nine repairs (RP-186 through RP-194) were observed and fixed (according to the project specifications) from Panel #35 and Panel #36. As outlined above, these repairs were associated with removing geomembrane wrinkles to allow the cap to conform to the contours of SA-6 South grade. These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications. Note: no repairs of the geomembrane from 8/5/15 were identified as non-compliance issues.
- Additionally, while the geomembrane was being patched / repaired, ESI also installed the penetration boots for the wells, piezometers, and gas vents protruding through the cap (Note: Penetration logs will be completed once final sealant is placed around top of boot). Orange composite (GDL) was also placed over butt seams of the geocomposite and leistered in place. These patching activities were completed (as needed) to allow Entact to continue placing protective cover soil over the installed GDL along the western end of SA6. The final GDL layer was inspected by Entact and Langan to ensure that all repairs / patches were completed prior to soil placement.
- While patch / repair work was being conducted, Langan and Entact conducted soil subgrade approval from approximate Sta. 15+80 to Sta. 15+10. Refer to *Soil Subgrade Approval* forms from 8/5/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

that the surface was free of any loose material. Refer to Photos #5,6 of the daily photo log for 8/5/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 15+80 to Sta. 15+10.

- Cap placement began with ESI placing the GCL along the southern slope (lower bench along southern end of SA-6 located below the groundwater table) of the southern edge of SA-6 (refer to *8/5/15 Photo Log*) as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with a granular bentonite.
- In addition to the GCL (placed along the southern slope), 16 oz. geotextile was placed along the northern boundary of the SA-6 South Cap, and also along the southern boundary east of the GCL (located at the areas above the groundwater table and outside of the GCL) over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications.
- GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/5/15 Photo Log* for supporting photographs.
- After installation of GCL and GVL along the SA-6 boundaries, geomembrane cap was installed continuing east of previously installed Panel #42 (located at approximate Sta. 15+80) on 8/3/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GCL and GCL layers. A total of three panel lengths were installed (P-47, P-48, P-49) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/5), *Trial Weld Log.*
- Installation and fusion welding of the geomembrane panels was conducted until the end of the work day. As such, no non-destructive testing on the installed panels was conducted. Additionally, no patch / repair work was completed, and no destructive samples were collected. These activities will be completed tomorrow (8/6/15). Note: An extrusion weld sample (DSX-5) was collected from the patch / repair work previously completed on 8/4/15.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as repair work was conducted to remove wrinkles from the cap to allow the geomembrane to properly conform to the contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/5/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).
- Review laboratory data for extrusion destruct sample DSX-5

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, and 8/4/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-12, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 15+10 to Sta. 14+10) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #49 (P-49) installed on 8/5/15 (located at approximate Sta. 15+10) running approximately 110 ft. east to Sta. 14+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI placing GDL over the previously installed geomembrane panels from 8/3/15. A total of 10 panel lengths of GDL were placed along the west side of the utility corridor and along the western slope of the utility corridor with end points of the GDL terminating along the approximate center of the utility corridor (east to west orientation). The GDL was placed north to south outside of the corridor and east to west within the corridor and secured with white plastic fasteners spaced at a maximum of 5 ft. and the top layer of geotextile was sewn (according to the project specs).
- While GDL was being placed over the previously installed geomembrane, Langan and Entact conducted soil subgrade approval from approximate Sta. 15+10 to Sta. 14+00. Refer to *Soil Subgrade Approval* forms from 8/6/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #7,8, and 9 of the daily photo log for 8/6/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 15+10 to Sta. 14+00.
- Cap placement began with ESI placing the GCL along the southern slope (lower bench along southern end of SA-6 located below the groundwater table) of the southern edge of SA-6 (refer to *8/6/15 Photo Log*) as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with granular bentonite.
- Prior to deploying any geomembrane panels over the GCL, it was confirmed that the GCL maintained intimate contact between the material and the HB wall (southern boundary wall). Soil was removed from the top of the sheet piles (as required) by Entact. Refer to Photo #14 of the *Photo Log 8/6/15*.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- In addition to the GCL (placed along the southern slope), 16 oz. geotextile was placed along the northern boundary of the SA-6 South Cap, and also along the southern boundary east of the GCL (located at the areas above the groundwater table and outside of the GCL) over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications.
- GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/6/15 Photo Log* for supporting photographs.
- After installation of GCL, 16 oz. geotextile (along SA-6 boundaries) and GVL, geomembrane cap was installed continuing east of previously installed Panel #49 (located at approximate Sta. 15+10) on 8/5/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GCL and GVL layers. A total of four panel lengths (lengths defined as running the approximate 165 ft. north to south distance of the cap) were installed (P-50, P-51, P-52, P-53, P-54) by ESI. Note: P-51 terminated approximately 6 ft. short of the southern boundary of the SA-6 cap. As such, the remaining section was taken from an additional roll (G15C277060) and labeled as Panel #52 (P-52).
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/6), *Trial Weld Log.*
- Upon panel installation and fusion welding, ESI conducted non-destructive seam testing in accordance with the project specs. No patch / repair work was completed, and no destructive samples were collected as work activities were completed after non-destruct testing was completed. These additional activities will be completed tomorrow (8/7/15).

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as non-destruct testing was in conformance with the project specs and no patch / repair work, or vacuum box testing was conducted on 8/6/15.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/6/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, and 8/5/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-12, and DSX-1 through DSX-5. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 14+00 to Sta. 13+00) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 8/6/15 |
| A3 – Photo Log | Pages 1 – 7 | Total of 14 photos outlining pertinent daily observations and descriptions for 8/6/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 8/6/15 |
| A5 – Subgrade Approval | Sheet 10 & ESI (8/6/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |
| A6 – Trial Weld Log | Pages 2-3 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 8/6/15. |
| A7 – Panel Placement Log | Page 11 | One panel placement log provided by ESI and confirmed by Langan for geomembrane placed on 8/6/15 |
| A8 – Destruct Seam Testing COC | | N / A no destruct samples collected on 8/6/15 |
| A9 – Seam/Non-Destruct. Test Log | Pages 11-12 | Seam Control Form provided by ESI and confirmed by Langan for non-destruct tests completed on 8/6/15 |
| A10 – Repair Log | | N / A no repairs completed on 8/6/15 |
| A11 – Conformance COC | | N / A for 8/6/15 |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) continuing from western end of SA-6 South. Material to be placed from Panel #54 (P-54) installed on 8/6/15 (located at approximate Sta. 14+00) running approximately 100 ft. east to Sta. 13+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work along the panels previously installed Panels 50-54 which were placed on 8/6/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/7/15).
- A total of twenty-three repairs (RP-195 through RP-217) were observed and fixed (according to the project specifications) from Panels #50 through Panel #54 (repair / detailing work conducted on panels installed on 8/6/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- One non-conformance issue was observed for a failed vacuum box test during testing of RP-215. The failed weld was patched and re-welded as outlined on Sheet #5.
- A total of three destruct samples were collected (DS-13, DS-14, and DSX-6). DS-13 and DS-14 (fusion) were collected from Panels 47/48 and 50/51, respectively. DSX-6 (extrusion) was collected from Panel #48 on RP-198.
- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for Collection Manhole #2. Note: The penetration log for Collection Manhole #2 will be completed once the boot has been sealed and covered according to the project specifications (to be completed on 8/10/15), and the final sealant is placed around top of boot.
- Langan and Entact conducted soil subgrade approval from approximate Sta. 14+00 to Sta. 13+00 while

patch work was being completed by ESI. Refer to *Soil Subgrade Approval* forms from 8/7/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material.Refer to Photo #6 of the daily photo log for 8/7/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 14+00 to Sta. 13+00.

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 14+00 (east of P-54) moving east (for approximately 100 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/7/15 Photo Log* for supporting photographs.
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #54 (located at approximate Sta. 14+00) on 8/6/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of five panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-55, P-56, P-57, P-58, P-59, P-60) by ESI. Note:, during placement of Panel #55 and #59, the roll of geomembrane was completed, thus, Panel #56 was placed for the last 11 ft. (from roll G15C283029) to complete the southern end and Panel #60 (P-60) was placed for the last 15 ft. (from roll G15C276053) to complete the northern end of SA-6.
- During installation of the Cap, geomembrane seams were overlapped a minimum of 4-inches for fusion welding (according to project specs). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specs. A total of six 1-inch specimens were collected for peel and shear testing (3 samples/each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/7), *Trial Weld Log.*
- Installation and fusion welding of the geomembrane panels was conducted until the end of the work day. Once completed, non-destructive testing on the installed panels was conducted. Non-destruct testing was conducted in accordance with the project specs and is further summarized on the *Seam Control Form (8/7/15).* After non-destructive testing the work day was terminated and no patch / repair work was completed. These activities will be completed on Monday (8/10/15).

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 5 (Sheet #5) – Failed vacuum box test of RP-215 on *Repair Log*
    - Failed vacuum box test of RP-215 (Panel #50). Failed weld was covered with a new patch and welded (RP-222) as per project specs and further defined in *Sheet 5 Notice of Non-Compliance*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/7/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 14+35).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-13, DS-14 and DSX-6

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, and 8/6/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-12, and DSX-1 through DSX-5. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 13+00 to Sta. 12+00) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/10/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 69/78° F, Overcast |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1645 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #18**<br>**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) continuing from western end of SA-6 South. Material to be placed from Panel #60 (P-60) installed on 8/7/15 (located at approximate Sta. 13+00) running approximately 100 ft. east to Sta. 12+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work along the panels previously installed Panels 55-60 which were placed on 8/7/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/10/15).
- A total of thirty-one repairs (RP-218 through RP-248) were observed and fixed (according to the project specifications) from Panels #55 through Panel #60 (repair / detailing work conducted on panels installed on 8/7/15). Refer to 8/10/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for well 115-W5-SO, and completed placing the geomembrane patch around Access Manhole #2. Note: The penetration log for well 115-W5-SO will be completed once the boot has been sealed and covered according to the project specifications and the final sealant is placed around top of boot.
- Langan and Entact conducted soil subgrade approval from approximate Sta. 13+00 to Sta. 12+00 while patch work was being completed by ESI. Refer to *Soil Subgrade Approval* forms from 8/10/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #5 and #6 of the daily photo log for 8/10/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 13+00 to Sta. 12+00.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 13+00 (east of P-60) moving east (for approximately 100 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/10/15 Photo Log* for supporting photographs.
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #60 (located at approximate Sta. 13+00) on 8/7/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of five panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-61, P-62, P-63, P-64, and P-65) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/10), *Trial Weld Log.*
- Installation and fusion welding of the geomembrane panels was conducted until the end of the work day. Once completed, non-destructive testing on the installed panels was conducted. Non-destruct testing was conducted in accordance with the project specs and is further summarized on the *Seam Control Form (8/10/15).* After non-destructive testing the work day was terminated and no patch / repair work was completed.
- A total of three destructive samples were collected (two fusion and one extrusion weld). Fusion weld destruct samples (DS-15, DS-16) were collected from Panel Seams 54/55 and 59/61 respectively. DSX-7 was collected along Panel 53/54 seam. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/10/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-15, DS-16, DS-17, and DSX-7

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, and 8/7/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-14, and DSX-1 through DSX-6. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 12+00 to Sta. 11+00) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/12/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 71/83° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1630 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #19**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #65 (P-65) installed on 8/10/15 (located at approximate Sta. 12+00) running approximately 100 ft. east to Sta. 11+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work along the panels previously installed Panels 61-66 which were placed on 8/10/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/12/15).
- A total of four repairs (RP-249 through RP-252) were observed and fixed (according to the project specifications) from Panels #64 through Panel #66 (repair / detailing work conducted on panels installed on 8/10/15). Refer to 8/12/15 *Repair Report* for supporting information. The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- While the geomembrane was being patched / repaired, ESI also installed / construction penetration boots for well 115-W5-SO and gas vent #5 (GV-5). Note: These penetration logs will be completed once the final clamps and seal (butyl seal) have been completed according to the project specifications and the final sealant is placed around top of boot.
- While ESI was conducting repair / patch work, Langan and Entact conducted soil subgrade observation from approximate Sta. 12+00 to Sta. 11+00. Based on visual inspection, the soil subgrade appeared to contain areas of soft / wet subgrade due to rainstorms from 8/11/15. Based on these soft areas, soil subgrade was not approved for geomembrane placement. Entact conducted additional preparation work (i.e. drying the soil and re-grading and re-compacting) as required, to conform the subgrade to the project specifications (refer to Photo #7 of the daily photo log for 8/12/15)

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- After completing patch / repair work from the panels installed on 8/10/15, ESI began to place GDL continuing east along the utility corridor. GDL was placed along the eastern slope of the utility corridor (located at approximate Sta. 16+50). Panels were oriented east to west within the utility corridor, and reverted back to the north and south orientation outside of the corridor (refer to the *8/12/15 Photo Log* for supporting photos)
- GDL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/12/15 Photo Log* for supporting photographs.
- No new geomembrane panels were placed as the soil subgrade for the next 100 ft. section was not approved. No destruct samples were collected, as DS-17 was collected on 8/10/15 during panel placement.
- Additionally, Entact placed protective cover soil over the previously installed geomembrane and GDL panels at the western end of SA-6. Protective cover soil was placed in 1 ft. lifts with caution tape placed at a maximum of 5 ft. spacing, placed over the GDL prior to soil placement.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as no new geomembrane panels were placed and the patch / repair work conducted on geomembrane cap was in compliance with the project specifications.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/12/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-17 (once received)

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, and 8/10/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-16, and DSX-1 through DSX-7. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 12+00 to Sta. 11+00) east of utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 8/12/15 |
| A3 – Photo Log | Pages 1 – 5 | Total of 10 photos outlining pertinent daily observations and descriptions for 8/12/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 8/12/15 |
| A5 – Subgrade Approval | | N / A no subgrade approved due to soft / wet conditions observed from storms on 8/11/15 |
| A6 – Trial Weld Log | Page 3 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 8/12/15. |
| A7 – Panel Placement Log | | N / A no panels placed on 8/12/15 |
| A8 – Destruct Seam Testing COC | Page 1 | Updated with destruct sample information collected from 8/12/15 |
| A9 – Seam/Non-Destruct. Test Log | Page 14-15 | Updated with vacuum box test conducted from 8/12/15 on Panels 64/66 |
| A10 – Repair Log | Page 12 | One repair report provided by ESI and confirmed by Langan for geomembrane repairs conducted on 8/12/15 |
| A11 – Conformance COC | | N / A for 8/12/15 |
| A12 – Destructive Seam Field Test | | N / A no destructive samples collected on 8/12/15 |
| A13 – Destruct. Sample Summary | | N / A no destructive samples collected on 8/12/15 |
| A14 – Penetration & Edge Form | | N / A final butyl seal required around boots before log can be completed |
| A16 – Notice of Non-Compliance | | N / A no non-compliance issues identified on 8/12/15 |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #65 (P-65) installed on 8/10/15 (located at approximate Sta. 12+00) running approximately 100 ft. east to Sta. 11+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with Langan and Entact conducting soil subgrade approval from approximate Sta. 12+00 to Sta. 11+00. Refer to *Soil Subgrade Approval* forms from 8/13/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #1 and #2 of the daily photo log for 8/13/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 12+00 to Sta. 11+00. Note: The soft / wet areas identified on 8/12/15 were allowed to dry and were repaired for geomembrane placement.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 12+00 (east of P-65) moving east (for approximately 100 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/13/15 Photo Log* for supporting photographs.
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #65 (located at approximate Sta. 12+00) on 8/10/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of five panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

installed (P-67, P-68, P-69, P-70, and P-71) by ESI.

- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/13), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 11+00, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (8/13/15) for non-destructive testing details. Based on the panel placement, minimal repairs were required along the installed panels. As such, no patch / repair work was conducted, and any associated repairs will be completed on 8/14/15.
- After completing non-destructive testing along the panels installed today (8/13/15), ESI began to place GDL continuing east from the 1st utility corridor (located at approx. Sta. 16+50). Panels were oriented from north to south (as outlined in the proposed GDL layout). GDL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/13/15 Photo Log* for supporting photographs.
- A total of two destructive samples were collected (two fusion welds). Fusion weld destruct samples (DS-18, DS-19) were collected from Panel Seams 64/65 and 68/69, respectively. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- Additionally, Entact placed protective cover soil over the previously installed geomembrane and GDL panels at the western end of SA-6. Protective cover soil was placed in 1 ft. lifts with caution tape placed at a maximum of 55-inch spacing, placed over the GDL prior to soil placement.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/13/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-17, DS-18, and DS-19 (once received)

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, and 8/12/15 as well as reviewed and approved daily ESI form submittals.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Reviewed laboratory destruct sample results for samples DS-1 through DS-16, and DSX-1 through DSX-7. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 80 ft. run east (approximately from Sta. 11+00 to Sta. 10+20) to Access Manhole #3 (ESI demobilization point).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #65 (P-71) installed on 8/13/15 (located at approximate Sta. 11+00) running approximately 80 ft. east to Sta. 10+20 (western slope of 2nd utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with Langan and Entact conducting soil subgrade approval from approximate Sta. 11+00 to Sta. 10+20. Refer to *Soil Subgrade Approval* forms from 8/14/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 11+00 to Sta. 10+20.
- Geocomposite clay liner (GCL), GVL and Cap placement began with ESI placing the GCL along the southern slope of SA-6 (lower bench) located below (to 1 ft. above) the water table as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with a granular bentonite.
- In addition to the GCL (placed along the southern slope below the groundwater table), 16 oz. geotextile was placed along the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 11+00 (east of P-71) moving east (for approximately 80 ft.) to Sta. 10+20. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/14/15 Photo Log* for supporting photographs.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #71 (located at approximate Sta. 11+00) on 8/13/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of four panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-72, P-73, P-74, and P-75) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/14), *Trial Weld Log*.
- Upon completion of geomembrane panel placement to approximate Sta. 10+20, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (8/14/15) for non-destructive testing details. Based on the panel placement, minimal repairs were required along the installed panels. ESI conducted patch / repair work for the panels installed on 8/13/15 (Panels 66-71) and 8/14/15 (Panels 72-75). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 8/14/15 for results (extrusion testing identified as EXT. on form).
- A total of ten repairs (RP-253 through RP-262) were observed and fixed (according to the project specifications) from Panel #71 through Panel #75 (repair / detailing work conducted on panels installed on 8/13/15 & 8/14/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), as well as seam joint repairs where non-destructive testing was conducted along the panel seams. These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- Upon completion of patch / repair activities, ESI began to pack and load equipment for their 2-week demob from the Site.
- A total of two destructive samples were collected (two fusion welds). Fusion weld destruct samples (DS-20, DS-21) were collected from Panel Seams 70/71 and 74/75, respectively. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- Additionally, Entact placed protective cover soil over the previously installed geomembrane and GDL panels at the western end of SA-6. Protective cover soil was placed in 1 ft. lifts with caution tape placed at a maximum of 55-inch spacing, placed over the GDL prior to soil placement.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/13/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70).

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-17, DS-18, DS-19, DS-20, and DS-21 (once received)

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, and 8/13/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-16, and DSX-1 through DSX-7. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 2nd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South after 2-week demobilization is complete.

|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 9/9/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 75/86° F, Clear AM, Clouds & Rain PM |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0630 – 1830 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #22**
**AmecFW**: Stu Bills, Dave Ambrose, Ari Eslaminejad, Brian Shea
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geosynthetic clay liner (GCL), and 60-mil geomembrane liner (Cap) continuing from western end of SA-6 South. Material to be placed from Panel #75 (P-75) installed on 8/14/15 (located at approximate Sta. 10+20 – western slope of utility corridor) running approximately 70 ft. east through 2nd utility corridor to approximate Sta. 9+50 (eastern slope of 2nd utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with Langan and Entact conducting soil subgrade approval from approximate Sta. 10+20 to Sta. 9+50. Refer to *Soil Subgrade Approval* forms from 9/9/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 10+20 to Sta. 9+50.
- While subgrade approval was being conducted, ESI completed patch / repair work for cap wrinkles that were observed from panel placement on 8/14/15. A total of thirty repairs (RP-263 through RP-292) were observed and fixed (according to the project specifications) from Panel #71 and Panel #73 (repair / detailing work conducted on panels installed on 8/14/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), where wrinkles were observed. These areas were subsequently patched and sealed with extrusion welds. No vacuum box testing was conducted on these repairs, and will be completed tomorrow (9/10).
- No non-conformance issues were recorded as patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- GCL and Cap placement began with ESI placing the GCL along the eastern and western slopes of the utility corridor and southern slope of SA-6 (lower bench) located below (to 1 ft. above) the water table as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with a granular bentonite.
- After installation of the GCL, geomembrane cap was installed continuing east of previously installed Panel #75 (located at approximate Sta. 10+20) on 8/14/15 and through the 2nd utility corridor. Panels were oriented from east to west (as proposed in the approved Panel Layout) and were placed on top of the GCL layer. A total of eleven panel lengths (panel lengths identified as the approximate 80 ft. run from east to west across the corridor, as well as geomembrane pieces which were used to complete the southern end of the corridor) were installed (P-76, P-77, P-78, P-79, P-80, P-81, P-82, P-83, P-84, P-85, and P-86) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/9), *Trial Weld Log.*
- No non-destructive testing or patch / repair work was conducted upon completion of geomembrane panel placement to approximate Sta. 9+50, as panel placement and fusion welded activities concluded the work day.
- One destructive sample was collected – DSX-8 (extrusion weld). Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- Additionally, Entact completed Site preparation activities for expectation of rainstorms tomorrow (9/10).

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/9/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DSX-8 (once received).

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite drainage layer (GDL), continuing from western end of SA-6 South. Material to be placed from geomembrane Panel #56 (located at approximate Sta. 14+20 – location where GDL had previously been placed to along with protective cover soil) running approximately 220 ft. east to Panel #68 (approximate Sta. 12+00)..
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting vacuum box testing for the repairs completed on 9/11/15 (as outlined in projecte specs). One vacuum box testing was complete, ESI began placing GDL from approximate Sta. 14+20 (Panel #56) to approximate Sta. 12+00 (Panel #68). GDL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft. intervals. Additionally, the top layer of geotextile was sewn (as outlined in the project specs).
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, the following rolls of GDL were cut with the first wrap of geocomposite removed prior to use
    - Roll 64021010124 – 10 ft. removed
    - Roll 64021010133 – 8 ft. removed
    - Roll 64021010126 – 10 ft. removed
    - Roll 64021010116- 5 ft. removed
    - Roll 64021010112 – 10 ft. removed
        - Note: this roll was not identified during the GDL inspection, however based on damage to the protective plastic liner observed in the field, the outside layer of GDL was removed.
    - Roll 64021010119 – 10 ft. removed
- Due to the inclement weather from 9/10/15 and potential storms over the weekend, the protective plastic covering the soil subgrade to the east was not removed. As such, no soil subgrade approval was conducted and no additional geomembrane panels were placed.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- One non-conformance issues was observed during placement of GDL. A rock was encountered underneath geomembrane panel #57. This non-conformance issue was recorded as RP-293 and will be patched and repaired on Monday (9/14).
- Upon completion of GDL placement to the approved panel location, a visual observation of the top of the western slope of the 2nd utility corridor was conducted by Langan and Entact. The geomembrane panels were pulled back to expose the GCL. Visual observation confirmed that the GCL was dry and no water had drained underneath the panels. The top of the slope was then sealed with a fusion weld "T-seams" along Panel #75 (oriented north to south) and Panel #76 through Panel #81 (oriented east to west).
- Geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/11), *Trial Weld Log.* Note: non-destructive testing was completed on the welded seams (to be completed Monday – 9/14/15).

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 6 (Sheet #6) – Subgrade irregularity identified as RP-293 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #57). Stone was subsequently removed, and hole was patched/repaired following project specs and further defined in *Sheet 6 Notice of Non-Compliance*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/11/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 4 gas vents).
- Review laboratory results for DSX-8 (once received).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, and 8/15/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-21, and DSX-1 through DSX-7. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 2nd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 9/11/15 |
| A3 – Photo Log | Pages 1 – 4 | Total of 8 photos outlining pertinent daily observations and descriptions for 9/11/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 9/11/15 |
| A5 – Subgrade Approval | | N / A no subgrade approval completed |
| A6 – Trial Weld Log | Page 4 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 9/11/15. |
| A7 – Panel Placement Log | | N / A no panels placed on 9/11/15 |
| A8 – Destruct Seam Testing COC | | N / A no destruct samples collected on 9/11/15 |
| A9 – Seam/Non-Destruct. Test Log | | N / A no non-destructive testing conducted on 9/11/15 |
| A10 – Repair Log | Pages 13-14 | One repair report provided by ESI and confirmed by Langan for geomembrane repairs conducted on 9/9/15 |
| A11 – Conformance COC | | N / A for 9/11/15 |
| A12 – Destructive Seam Field Test | | N / A no destruct samples collected on 9/11/15 |
| A13 – Destruct. Sample Summary | | N / A no destruct samples collected on 9/11/15 |
| A14 – Penetration & Edge Form | | N / A final butyl seal required around boots before log can be completed |
| A16 – Notice of Non-Compliance | Sheet #6 | One non-compliance issue identified on 9/11/15 and recorded on Sheet #6 |

| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 58/74° F, Clear |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 0630 – 1630 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #24**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite drainage layer (GDL), continuing from western end of SA-6 South. Material to be placed from geomembrane Panel #68 (located at approximate Sta. 12+00 – location where GDL had previously been placed to - based on approved as-built drawings) running approximately 170 ft. east to Panel #74 located at top of western slope of 2nd utility corridor (approximate Sta. 10+30).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI placing GDL from approximate Sta. 12+00 (Panel #68) to approximate Sta. 10+30 (Panel #75). GDL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft. intervals. Additionally, the top layer of geotextile was sewn (as outlined in the project specs).
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, no rolls of GDL were required to be cut to remove the first wrap of geocomposite prior to use.
- While GDL was being placed, ESI conducted non-destructive testing (air pressure testing) of the geomembrane panel seams installed on 9/9/15 in accordance with the project specifications. Refer to *Seam Control Form* (9/14/15) for non-destructive testing details.
- Once non-destructive testing was completed, ESI completed patch / repair along the panels previously installed, Panels 76-86 which were placed on 9/9/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (9/14/15).
- A total of twenty-three repairs (RP-293 through RP-315) were observed and fixed (according to the project specifications) from Panels #76 through Panel #86 (repair / detailing work conducted on panels installed on 9/11/15). Refer to 9/14/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for gas vent GV-3, and completed placing the geomembrane patch around Access Manhole #3. Note: The penetration logs for all boots to date will be completed once the boot has been sealed with butyl sealant.
- One destructive sample (DS-22) was collected (fusion) from Panel Seams 79/80. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- During cap placement activities, Entact spread protective cover soil moving east from approximate Sta. 14+20. Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/14/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 5 gas vents).
- Review laboratory results for DS-22 (once received).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, and 9/11/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-21, and DSX-1 through DSX-8. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 2nd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap), and continuing from eastern end of 2nd utility corridor. Material to be placed from Panels #76, 77, 78, 79, 80, 81, and 86 (panels running east to west through utility corridor) installed on 9/9/15 (located at approximate Sta. 9+50) running approximately 100 ft. east to Sta. 8+50. Panels installed today (9/15) will "T" into the panels outlined above as panels will revert back to north-south orientation outside of utility corridor (as per the approved panel layout).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with Langan and Entact conducting soil subgrade approval from approximate Sta. 9+50 (eastern end of 2nd utility corridor) to Sta. 8+50. Refer to *Soil Subgrade Approval* forms from 9/15/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #1 and #2 of the daily photo log for 9/15/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 9+50 to Sta. 8+50.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 9+50 (east of 2nd utility corridor) moving east (for approximately 100 ft.) to approximate Sta. 8+50. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *9/15/15 Photo Log* for supporting photographs.
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panels #76-81, and #86 (running east-west through 2nd utility corridor) on 9/9/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

layers. A total of four panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-87, P-88, P-89, and P-90) by ESI.

- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/15), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 8+50, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/15/15) for non-destructive testing details. Based on the panel placement, minimal repairs were required along the installed panels. As such, patches were leistered over the repairs with the final extrusion welds to be completed on 9/16/15.
- One destructive sample (DS-23) was collected (fusion) from Panel Seams 88/89. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- ESI pulled back the installed geomembrane panels along the northern and southern ends of the 2nd utility corridor to expose the underlying GCL. The GCL appeared to be hydrated (approximate 10 ft. wide section along southern end of corridor and approximate 4 ft. wide section along northern end of corridor) from rainwater infiltration that washed back underneath the cap due to the soil subgrade outside of the cap which was not yet completed to grade. These sections of GCL were cut and removed and the area was left open to dry overnight. New GCL pieces will be placed (according to the project specs) on 9/16/15.
- With cap activities complete, ESI filled sandbags for the remainder of the work day.
- During cap placement activities, Entact spread protective cover soil moving east from approximate Sta. 14+20. Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/15/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 5 gas vents).
- Review laboratory results for DS-23 (once received).

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, and 9/14/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-22, and DSX-1 through DSX-8. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 2nd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** | Honeywell International, Inc. | **DATE:** | 9/16/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 63/85° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 0630 – 1530 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #26**
**AmecFW**: Geoff Shallard, Dave Ambrose, Ari Eslaminejad
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## *Site Activities*

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap), and continuing from eastern end of 2nd utility corridor. Material to be placed from Panel #90 (P-90) installed on 9/15/15 and located at approximate Sta. 8+50 running approximately 80 ft. east to Sta. 7+70.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting vacuum box testing on the repairs completed from 9/14/15 (through 2nd utility corridor). ESI also conducted patch / repair work for the panels installed on 9/15/15 (Panels 87-90). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 9/16/15 for results (extrusion testing identified as EXT. on form).
- A total of forty-four repairs (RP-316 through RP-349) were observed and fixed (according to the project specifications) from Panel #87 through Panel #90 (repair / detailing work conducted on panels installed on 9/15/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), as well as seam joint repairs where non-destructive testing was conducted along the panel seams. These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- Along with the repair work, ESI also placed the new pieces of GCL (refer to Photo Log) for the northern and southern areas along the 2nd utility corridor where the GCL was hydrated. One area along the southern section required the liner to be cut to pull back and expose the GCL. As such, this repair (RP-331) was identified as a non-conformance issue (subgrade irregularity) and is further defined below.
- While patch / repair work was being completed, Langan and Entact conducting soil subgrade approval from approximate Sta. 8+50 (moving east from P-90) to Sta. 7+70. Refer to *Soil Subgrade Approval* forms from 9/16/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photo #6 of the daily photo log for 9/16/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 8+50 to Sta. 7+70.

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 8+50 (moving east of P-90) moving east (for approximately 80 ft.) to approximate Sta. 7+70. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *9/16/15 Photo Log* for supporting photographs.
- As per the QA inspection conducted on the GVL on September 3, 2015, by AmecFW, the following rolls of GVL were cut with the first wrap of geocomposite removed prior to use
    - Roll 65211010130 – 8 ft. removed
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #90 on 9/15/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of four panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-91, P-92, P-93, and P-94) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/16), *Trial Weld Log*.
- Upon completion of geomembrane panel placement to approximate Sta. 7+70, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/16/15) for non-destructive testing details. Based on the panel placement, minimal repairs were required along the installed panels. As such, patches were leistered over the repairs with the final extrusion welds to be completed on 9/17/15.
- One destructive sample (DSX-9) was collected (extrusion weld) from Panel Seams 88/89. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- During cap placement activities, Entact spread protective cover soil moving east from approximate Sta. 14+20. Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 7 (Sheet #7) – Subgrade irregularity identified as RP-293 on *Repair Log*
    - GCL underneath geomembrane liner along southern end of utility corridor hydrated from rainwater accumulating outside of cap due to subgrade (subgrade outside of the cap not final). Geomembrane liner pulled back and cut to remove and replace sections of GCL. This patch was noted as a subgrade irregularity and was patched/repaired following project specs and is further defined on *Sheet 7 Notice of Non-Compliance*

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/16/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 5 gas vents).
- Review laboratory results for DSX-9 (once received).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, and 9/15/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-23, and DSX-1 through DSX-8. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 2nd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #27**<br>**AmecFW**: Stu, Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite drainage layer (GDL) geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap), continuing from eastern end of 2nd utility corridor. Material to be placed from Panel #94 (P-94) installed on 9/16/15 and located at approximate Sta. 7+70 running approximately 70 ft. east to Sta. 7+00 (top western slope of 3rd utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work for the panels installed on 9/16/15 (Panels 91-94). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 9/17/15 for results (extrusion testing identified as EXT. on form).
- A total of seventeen repairs (RP-350 through RP-366) were observed and fixed (according to the project specifications) from Panel #91 through Panel #94 (repair / detailing work conducted on panels installed on 9/16/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), as well as seam joint repairs where non-destructive testing was conducted along the panel seams. These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications. Additionally, custom fit repairs were conducted along the top eastern slope of the 2nd utility corridor (Panel #80) to remove observed wrinkles in the geomembrane panels. Vacuum box testing was then completed on the repairs (as per the project specifications) to confirm the integrity of the extrusion welds.
- Once the patch / repair work was completed ESI began placing GDL from approximate Sta. 10+30 (Panel #75) to approximate Sta. 9+60 (Panel #87). GDL was placed through the 2nd utility corridor with the panels oriented east to west, and was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft. intervals. Additionally, the top layer of geotextile was sewn (as outlined in the project specs).
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, no rolls of GDL were required to be cut to remove the first wrap of geocomposite prior to use.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- While GDL placement was being conducted, Langan and Entact completed soil subgrade approval from approximate Sta. 7+70 (moving east from P-94) to Sta. 7+00 (top western slope of 3rd utility corridor). Refer to *Soil Subgrade Approval* forms from 9/17/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 7+70 to Sta. 7+00.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 7+70 (moving east of P-94) moving east (for approximately 70 ft.) to approximate Sta. 7+00. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *9/17/15 Photo Log* for supporting photographs.
- As per the QA inspection conducted on the GVL on September 3, 2015, by AmecFW, no rolls of GVL were required to be cut to remove first wrap of geocomposite prior to use
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #94 on 9/16/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of three panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-95, P-96, and P-97) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/17), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 7+00, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/17/15) for non-destructive testing details. Based on the panel placement, minimal repairs were required along the installed panels. As such, patches were leistered over the repairs with the final extrusion welds to be completed on 9/18/15.
- One destructive sample (DS-24) was collected (fusion weld) from Panel Seams 91/92. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- During cap placement activities, Entact spread protective cover soil moving east from approximate Sta. 14+20. Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/17/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 5 gas vents).
- Review laboratory results for DS-24 (once received).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, and 9/16/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-23, and DSX-1 through DSX-9. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 through, and east of 3rd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

## ***Site Activities***

- Langan onsite for observation of placement of geosynthetic clay liner (GCL) geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap), through 3rd utility corridor (located at approximate Sta. 6+80). Material to be placed from Panel #97 (P-97) installed on 9/17/15 and located at approximate Sta. 7+00 running approximately 60 ft. east through 3rd utility corridor to Sta. 6+40 (top eastern side of 3rd utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with Langan and Entact conducting soil subgrade approval from approximate Sta. 7+00 (P-97 installed on 9/17/15) through the 3rd utility corridor to Sta. 6+40. Refer to *Soil Subgrade Approval* forms from 9/18/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 7+00 to Sta. 6+40.
- GCL and Cap placement began with ESI placing GVL along the eastern and western slopes of the 3rd utility corridor. GVL was placed at the areas above the groundwater table down the slopes of the corridor (GCL areas comprised the bottom of the utility corridor to approximately 2 ft. to 3 ft. up the side slopes). GVL was secured with white plastic fasteners spaced at a maximum of 5 ft. and was sewn along the top layer of geotextile (as outlined in the project specs).
- GCL was then placed along the bottom of the 3rd utility corridor, and along the eastern and western slopes of the utility corridor and southern slope of SA-6 (lower bench) located below (to 1 ft. above) the water table as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with a granular bentonite. The GVL overlapped the GCL a minimum of 1 ft. along the bottom slopes of the corridor, and the GCL was secured into the side slopes via soil stakes / staples.
- After installation of the GCL, geomembrane cap was installed continuing east of previously installed Panel #97 (located at approximate Sta. 7+-00) on 9/17/15 and through the 3rd utility corridor. Panels

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

were oriented from east to west (as proposed in the approved Panel Layout) and were placed on top of the GVL and GCL layers.

- A total of nine panel lengths (panel lengths identified as the approximate 68 ft. run from east to west across the corridor, as well as geomembrane pieces which were used to complete the southern end of the corridor) were installed (P-98, P-99, P-100, P-101, P-102, P-103, P-104, P-105, and P-106) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/18), *Trial Weld Log.*
- As per the QA inspection conducted on the GVL on September 3, 2015, by AmecFW, no rolls of GVL were required to be cut to remove the first wrap of geocomposite prior to use.
- Upon completion of geomembrane panel placement to approximate Sta. 6+40, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/18/15) for non-destructive testing details. Based on the panel placement, minimal repairs were required along the installed panels. As such, patches were leistered over the repairs with the final extrusion welds to be completed on 9/21/15.
- Two destructive samples (DS-25 and DS-26) were collected (fusion welds) from Panel Seams 94/95 and 97/97, respectively. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.
- During cap placement activities, Entact spread protective cover soil moving east from approximate Sta. 14+20. Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/18/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2$^{nd}$ utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 6 gas vents).
- Review laboratory results for DS-25 and DS-26 (once received).

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** | Honeywell International, Inc. | **DATE:** | 9/21/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 66/83° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 0630 – 1500 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #29**
**AmecFW**: Dave Ambrose, Brian Shea, Ari Eslaminejad
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite drainage layer (GDL), continuing through 2nd utility corridor (located at approximate Sta. 10+00).. Material to be placed from eastern slope of 2nd utility corridor (Panels 76-81; running east to west) located at approximate Sta. 10+30) running approximately 250 ft. east to Panel #93 (located at approximate Sta. 7+80).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI placing GDL from approximate Sta. 10+30 (eastern slope of 2nd utility corridor) to approximate Sta. 7+80 (Panel #93). GDL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft. intervals. Additionally, the top layer of geotextile was sewn (as outlined in the project specs).
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, no rolls of GDL were required to be cut to remove the first wrap of geocomposite prior to use.
- Once GDL was completed to the (based on the approved as-builts) , ESI completed patch / repair along the panels previously installed, Panels 95-106 which were placed on 9/17/15 and 9/18/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (9/21/15).
- A total of thirty-two repairs (RP-367 through RP-398) were observed and fixed (according to the project specifications) from Panels #95 through Panel #106 (repair / detailing work conducted on panels installed on 9/17/15 and 9/18/15). Refer to 9/21/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for gas vent GV-2. Note: The penetration logs for all boots to date will be completed once the boot has been sealed with butyl sealant.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- One destructive sample (DSX-10) was collected (extrusion) from RP-376. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/21/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 6 gas vents).
- Review laboratory data for destruct sample DSX-10 (extrusion) once received

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, and 9/18/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-26, and DSX-1 through DSX-9. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas east of 3rd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 9/22/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 62/84° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0630 – 1530 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #30**
**AmecFW**: Stu Bills, Dave Ambrose, Brian Shea, Ari Eslaminejad
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap), continuing past eastern side of 3rd utility corridor. Material to be placed from Panels #98, 99, 100, 101, 102, 103, and 106 (panels running east to west through 3rd utility corridor) installed on 9/18/15 (located at approximate Sta. 6+40) running approximately 110 ft. east to Sta. 5+30. Panels installed today (9/22) will "T" into the panels outlined above as panels will revert back to north-south orientation outside of utility corridor (as per the approved panel layout).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with Langan and Entact conducting soil subgrade approval from approximate Sta. 6+40 (eastern end of 3rd utility corridor) to Sta. 5+30. Refer to *Soil Subgrade Approval* forms from 9/22/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #2 and #3 of the daily photo log for 9/22/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 6+40 to Sta. 5+30.
- While subgrade inspection was being conducted, ESI conducted vacuum box testing for the repairs completed on 9/21/15, and also installed the remaining panels of GDL from geomembrane Panel #93 to Panel #96.
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, one roll of GDL was required to be cut to remove the first wrap of geocomposite prior to use – Roll #64021010086 (8 ft. cut).
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 6+40 (east of 3rd utility corridor) moving east (for approximately 110 ft.) to approximate Sta. 5+30. GVL was placed according to

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *9/22/15 Photo Log* for supporting photographs.

- As per the QA inspection conducted on the GVL on September 3, 2015, by AmecFW, one roll of GVL was required to be cut to remove the first wrap of geocomposite prior to use – Roll #65211010113 (8 ft. cut)
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panels #98-103, and #106 (running east-west through 3rd utility corridor) on 9/18/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of four panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-107, P-108, P-109, and P-110) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/22), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 5+30, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/22/15) for non-destructive testing details.
- Once non-destructive testing was completed, ESI conducted patch / repair along the panels installed, Panels 107-110. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (9/22/15).
- A total of nineteen repairs (RP-399 through RP-417) were observed and fixed (according to the project specifications) from Panels #107 through Panel #110 (repair / detailing work conducted on panels installed on 9/22/15). Refer to 9/22/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for piezometer PZ-14. Note: The penetration logs for all boots to date will be completed once the boot has been sealed with butyl sealant.
- No destructive samples were collected, as an RFI was submitted to AmecFW, and based on the results of the first 26 destruct samples – the sampling frequency was decreased from 500 LF to 1500 LF as samples yielded zero failures with all 26 exhibited shear and peel results greater than the minimum requirements (as per the project specs).
- During cap placement activities, Entact spread protective cover soil for the area immediately west of the 2nd utility corridor (approximate Sta. 10+20). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/15/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 4 piezometers, and 5 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, and 9/21/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-26, and DSX-1 through DSX-10. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 3rd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 58/79° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0630 – 1700 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #31**<br>**AmecFW**: Stu Bills, Dave Ambrose, Brian Shea, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), geosynthetic clay liner (GCL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing past eastern side of 3rd utility corridor. Material to be placed from Panels #110 installed on 9/22/15 (located at approximate Sta. 5+30) running approximately 80 ft. east to Sta. 4+50.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI deploying rolls of GDL from Panel #96/97 (approximate Sta. 7+00) through 3rd utility corridor to approximate Sta. 5+30 (Panel #110 placed on 9/22/15). GDL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft., and top layer of geotextile sewn along the panel seams.
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, the following rolls of GDL was required to be cut to remove the first wrap of geocomposite prior to use:
    - Roll #64021010103 - 5 ft. cut and removed
    - Roll #64021010105 – 8 ft. cut and removed
- Langan and Entact conducting soil subgrade approval from east of Panel #110 (located at approximate Sta. 5+30) to approximate Sta. 4+50. Refer to *Soil Subgrade Approval* forms from 9/23/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #1 and #2 of the daily photo log for 9/23/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 5+30 to Sta. 4+50.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 5+30 (east of 3rd utility

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

corridor) moving east (for approximately 80 ft.) to approximate Sta. 4+50. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *9/23/15 Photo Log* for supporting photographs.

- As per the QA inspection conducted on the GVL on September 3, 2015, by AmecFW, no rolls of GVL were required to be cut to remove the first wrap of geocomposite prior to use.
- In addition to the GVL, GCL was placed along the northern and southern edges of SA-6 at areas below (to 1 ft. above) the groundwater table (as shown on the drawings and outlined in the project specs). GCL was overlapped a minimum of 1 ft. along the seams with granular bentonite placed along the edges (as outlined in the project specs).
- After installation of the GVL and GCL, geomembrane cap was installed continuing east of previously installed Panel #110 on 9/22/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL and GCL layers. A total of four panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-111, P-112, P-113, and P-114) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, a trial weld (smooth to smooth) was conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/23), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 4+50, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/23/15) for non-destructive testing details.
- One patch / repair (RP-418) was completed as a pipe boot for well 115-E1A-SO located at Panel #109. The boot was constructed according to the project specs (final butyl seal still to be applied). No destruct samples were collected from 9/23/15.
- During cap placement activities, Entact continued to spread protective cover soil for the area through the 2nd utility corridor (approximate Sta. 10+00). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project and no patch / repair work was conducted.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/23/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 4 piezometers, and 6 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), and Main Access Manhole #3 (located at western slope of 2nd utility corridor).

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, and 9/22/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-26, and DSX-1 through DSX-10. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 3rd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| **ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **AmecFW**: Stu Bills, Brian Shea, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), geosynthetic clay liner (GCL), and 60-mil geomembrane liner (Cap), continuing along eastern side of 3rd utility corridor. Material to be placed from Panel #114 installed on 9/23/15 (located at approximate Sta. 4+50) running approximately 70 ft. east to Sta. 3+80.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair along the panels previously installed, Panels 111-114 which were placed on 9/23/15. Prior to repair work, a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (9/24/15).
- A total of seven repairs (RP-419 through RP-424) were observed and fixed (according to the project specifications) from Panels #111 through Panel #114 (repair / detailing work conducted on panels installed on 9/23/15). Refer to 9/24/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- One non-compliance issue was observed and was noted on *Sheet #8 Notice of Non-Compliance and Corrective Action Form.* This non-compliance was also noted on the Repair Log as a subgrade irregularity and was identified as RP-423. This non-compliance issue was identified based on a rock that was observed underneath the geomembrane cap. The rock was removed from underneath the liner and the hole was patched / repaired according to the project specifications and further outlined in the *Non-Compliance and Corrective Action* forms – *Sheet #8* for 9/24/15.
- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for well 115-E1A-SO and Access Manhole #4. Note: The penetration logs for all boots to date will be completed once the boots have been sealed with butyl sealant (not yet completed).

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- While ESI was completing patch / repair work, Langan and Entact conducted soil subgrade approval from east of Panel #114 (located at approximate Sta. 4+50) to approximate Sta. 3+80. Refer to *Soil Subgrade Approval* forms from 9/24/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3 and #4 of the daily photo log for 9/24/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 4+50 to Sta. 3+80.
- GVL and Cap placement began with ESI placing the GCL along the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The GCL was overlapped approximately 2 ft. outside of the cap and was placed along the areas below (to 1 ft. above) the water table (as shown on the drawings and outlined in the project specs). This included the areas within the SA-6 cap along the bottom and side slopes of the drainage/utility ditches located from approximate Sta. 4+50 to Sta. 3+80. GCL was overlapped a minimum of 1 ft. along the seams with granular bentonite placed along the edges (as outlined in the project specs).
- After the GCL was placed, GVL was installed from approximate Sta. 4+50 (Panel #114) moving east (for approximately 70 ft.) to approximate Sta. 3+80. GVL was placed along the areas outside of the water GCL (outside of the water table influence) and according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *9/24/15 Photo Log* for supporting photographs. Note: The GVL was cut along the drainage / utility to expose the GCL as a minimum of 1 ft. of overlap was required along the ditches where the GVL and GCL intersected.
- As per the QA inspection conducted on the GVL on September 3, 2015, by AmecFW, no rolls of GVL were required to be cut to remove the first wrap of geocomposite prior to use.
- After installation of the GVL and GCL, geomembrane cap was installed continuing east of previously installed Panel #114 on 9/23/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL and GCL layers. A total of four panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-115, P-116, P-117, and P-118) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, two trial welds (smooth to smooth and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/24), *Trial Weld Log*.
- Upon completion of geomembrane panel placement to approximate Sta. 4+50, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/24/15) for non-destructive testing details.
- No patch / repair work was conducted on Panels #115 through #118 as part of the activities on 9/24/15.
- Two destructive samples were collected for laboratory testing. DS-27 (fusion) was collected from Panel Seam 110/111 and is noted as RP-422 on the *Repair Log*. Fusion weld destruct samples collected at 1500 LF intervals (as per the approved RFI to reduce the sampling frequency from 500 LF to 1500 LF). One extrusion weld sample (DSX-11) was also collected from RP-421 and is noted as RP-424 on the *Repair Log*. Extrusion weld samples collected at 500 LF intervals as per the project specs.
- During cap placement activities, Entact continued to spread protective cover soil for the area through the 2nd utility corridor (approximate Sta. 10+00). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 8 (Sheet #8) – Subgrade irregularity identified as RP-423 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #111). Stone was subsequently removed, and hole was patched/repaired following project specs and further defined in *Sheet 8 Notice of Non-Compliance*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/24/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 3 wells, 4 piezometers, and 6 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), Main Access Manhole #3 (located at western slope of 2nd utility corridor), and Manhole #4.
- Review laboratory destruct data for destruct samples DS-27 and DSX-11.

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, 9/22/15, and 9/23/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-26, and DSX-1 through DSX-10. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas of SA-6 east of 3rd Utility Corridor. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 9/25/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 63/73° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0630 – 1630 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #33**
**AmecFW**: Stu Bills, Brian Shea, Ari Eslaminejad
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geosynthetic clay liner (GCL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing along eastern side of 3rd utility corridor. Material to be placed from Panel #118 installed on 9/24/15 (located at approximate Sta. 3+80) running approximately 50 ft. east to Sta. 3+30.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair along the panels previously installed, Panels 114-118 which were placed on 9/24/15. Prior to repair work, a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (9/25/15).
- A total of twenty repairs (RP-425 through RP-444) were observed and fixed (according to the project specifications) from Panels #114 through Panel #118 (repair / detailing work conducted on panels installed on 9/24/15). Refer to 9/25/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications. No non-compliance issues were identified as patch / repair work completed was custom fit repairs to allow geomembrane to conform to SA-6 contours. Note: RP-425 has been marked in the field by the project team, however, the repair (pipe boot for GV-2) has not yet been completed.
- Site activities commenced with ESI deploying rolls of GDL from Panel #110 (approximate Sta. 5+30) to approximate Sta. 4+50 (Panel #114 placed on 9/23/15). GDL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft., and top layer of geotextile sewn along the panel seams.
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, no rolls of GDL were required to be cut to remove the first wrap of geocomposite prior to use.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- While ESI was placing GDL, Langan and Entact conducted soil subgrade approval from east of Panel #118 (located at approximate Sta. 3+80) to approximate Sta. 3+30. Refer to *Soil Subgrade Approval* forms from 9/25/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #5 and #6 of the daily photo log for 9/25/2015, for supporting subgrade photos (along with GCL placement). This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 3+80 to Sta. 3+30.
- GVL and Cap placement began with ESI placing the GCL along the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The GCL was overlapped approximately 2 ft. outside of the cap and was placed along the areas below (to 1 ft. above) the water table (as shown on the drawings and outlined in the project specs). This included the remaining area within the SA-6, as the lower bench east of Sta. 3+80 was comprised of areas below the water table elevation. GCL was overlapped a minimum of 1 ft. along the seams with granular bentonite placed along the edges (as outlined in the project specs). Note: no GVL was placed as the subgrade required GCL placement for the entire area (below the water table elevation).
- After installation of the GCL, geomembrane cap was installed continuing east of previously installed Panel #118 on 9/24/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GCL layer. A total of two panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-119 and P-120) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, two trial welds (smooth to smooth and texture to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/25), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 3+30, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/25/15) for non-destructive testing details.
- ESI completed patch / repair work for the minor repairs associated with the placement of Panels 119 & 120 (RP-437 through RP-444) as identified previously in this report and reflected on the *Repair Log* from 9/25/15.
- No destructive samples were collected from 9/25/15
- During cap placement activities, Entact continued to spread protective cover soil for the area through the 2nd utility corridor (approximate Sta. 10+00). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project and patch / repair work completed consisted of custom fit repairs to allow the geomembrane to conform to the SA-6 contours.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/25/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 3 wells, 4 piezometers, and 6 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), Main Access Manhole #3 (located at western slope of 2nd utility corridor), and Manhole #4.

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, 9/22/15, 9/23/15, and 9/24/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-27, and DSX-1 through DSX-11. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas along far eastern end of SA-6. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** | Honeywell International, Inc. | **DATE:** | 9/29/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 69/79° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 0630 – 1600 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #34**
**AmecFW**: Stu Bills, Brian Shea, Ari Eslaminejad
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geosynthetic clay liner (GCL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing along eastern side of 3rd utility corridor. Material to be placed from Panel #120 installed on 9/25/15 (located at approximate Sta. 3+30) running approximately 80 ft. east to Sta. 2+50.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI deploying rolls of GDL from Panel #114 (approximate Sta. 4+50) to approximate Sta. 3+80 (Panel #118 placed on 9/24/15). GDL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft., and top layer of geotextile sewn along the panel seams.
- As per the QA inspection conducted on the GDL on September 3, 2015, by AmecFW, the following rolls of GDL were required to be cut to remove the first wrap of geocomposite prior to use:
    - Roll #64021010072 – Approximately 8 ft. removed
    - Roll #64021010064 – Roll not on inspection list. Approximately 30 ft. removed due to damage observed from forklift
- While ESI was placing GDL, Langan and Entact conducted soil subgrade approval from east of Panel #120 (located at approximate Sta. 3+30) to approximate Sta. 2+50. Refer to *Soil Subgrade Approval* forms from 9/29/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #2 and #3 of the daily photo log for 9/29/2015, for supporting subgrade photos (along with GCL placement). This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 3+30 to Sta. 2+50.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- GVL and Cap placement began with ESI placing the GCL along the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The GCL was overlapped approximately 2 ft. outside of the cap and was placed along the areas below (to 1 ft. above) the water table (as shown on the drawings and outlined in the project specs). This included the remaining area within the SA-6, as the lower bench east of Sta. 3+30 was comprised of areas below the water table elevation. GCL was overlapped a minimum of 1 ft. along the seams with granular bentonite placed along the edges (as outlined in the project specs).
- Upon placement of the GCL, GVL was placed along the upper elevations within the areas outside of the water table influence (as shown on the project drawings). GVL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft. intervals and the top layer of geotextile sewn.
- After installation of the GCL and GVL, geomembrane cap was installed continuing east of previously installed Panel #120 on 9/25/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GCL and GVL layers. A total of five panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-120, P-121, P-122, P-123, P-124, and P-125) by ESI. Note: During placement of geomembrane panel P-123, the roll of geomembrane terminated within the SA-6 approximately 20 ft. from the southern end of the cap. Thus an additional panel (P-124) was required to complete the geomembrane run from north to south.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, three trial welds (smooth to smooth, smooth to texture, and texture to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (9/29), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 2+50, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (9/29/15) for non-destructive testing details. Once, non-destructive testing was completed, ESI then conducted patch/ repair work for the panels installed.
- A total of eleven repairs (RP-445 through RP-455) were observed and fixed (according to the project specifications) from Panels #121 through Panel #125 (repair / detailing work conducted on panels installed on 9/24/15). Refer to 9/29/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications. No non-compliance issues were identified as patch / repair work completed was custom fit repairs to allow geomembrane to conform to SA-6 contours.
- No destructive samples were collected from 9/29/15
- During cap placement activities, Entact continued to spread protective cover soil for the area through the 3rd utility corridor (approximate Sta. 6+80, moving east). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project and patch / repair work completed consisted of custom fit repairs to allow the geomembrane to conform to the SA-6 contours.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Pending***

- Complete Daily Report and Photo Log (for 9/29/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 3 wells, 4 piezometers, and 6 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), Main Access Manhole #3 (located at western slope of 2nd utility corridor), and Manhole #4.

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, 9/22/15, 9/23/15, 9/24/15, and 9/25/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-27, and DSX-1 through DSX-11. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas along far eastern end of SA-6. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** | Honeywell International, Inc. | **DATE:** | 10/07/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 60/72° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 0630 – 1600 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #35**
**AmecFW**: Stu Bills, Brian Shea, Ari Eslaminejad
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite drainage layer (GDL) continuing along eastern side of 3rd utility corridor, and patch / repair work associated with panels placed from 9/29/15.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI completing patch / repair work for minor wrinkles from panels previously placed on 9/29/15 (Panels 121 – 125). During the patch / repair work it was observed that the GCL underlying the geomembrane panels was hydrated with standing water present at two areas:
    - Area 1 was comprised of the drainage / utility swale located along the southern end of SA-6 (approximate Sta. 3+50 to Sta. 2+60 ). At this area, a sump pump pit was located immediately outside of SA-6 cap to the south. During the storm events over the weekend, this pump at one point shut down thus causing a build-up (ponding) of water that extended laterally into the swale and hydrating the GCL.
    - Area 2 was located along the northern end of the cap (approximate Sta. 4+00 to Sta. 3+40) along the SCB wall. During the storm events water from the adjacent roadway (higher elevation than the SA-6 cap as final grading has not yet been completed) ran along the edges of SA-6 causing some soil washout, which allowed the water to infiltrate laterally over the SCB wall and onto the lower portion of SA-6.
- For both of these areas, the geomembrane cap was pulled back to expose the hydrated GCL. The GCL was then cut and removed to expose the underlying soil subgrade. Visual observation of the subgrade showed that the soil was in good condition (firm and unyielding) with no wet or wash out areas observed. New GCL was then placed in these areas with minimum of 1 ft. of overlap and granular bentonite placed along the seams as per project specifications. Refer to *10/7/15 Photograph Log* for supporting Site photos.
- Once the new GCL was placed, the geomembrane panels were patch / repaired (as required) over these areas.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- A total of twenty repairs (RP-456 through RP-475) were observed and fixed (according to the project specifications) from Panels #119 through Panel #122 (repair / detailing work for replaced GCL on panels installed from 9/29/15). Refer to 10/7/15 *Repair Report.* The majority of these repairs were patch / repairs associated with the removal and replacing of the hydrated GCL. These repairs were identified as subgrade irregularities on the *Repair Report,* and were identified as non-compliance issues on *Sheet #9* and *Sheet #10 Notice of Non-Compliance* forms, respectively. Note: RP-457 which consisted of a pipe boot for GV-0 was marked in the field and noted on the Repair Report (as RP-457), however the boot and repair itself has not yet been completed.
- Two destructive samples were collected from 10/7/15. Destruct sample DS-28 (fusion) was collected from Panel #123/125, and sample DSX-12 was collected from RP-459 (Panel #123).
- During cap placement activities, Entact continued to spread protective cover soil for the area through the 3rd utility corridor (approximate Sta. 6+80, moving east). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 9 (Sheet #9) – Subgrade irregularity (hydrated GCL) identified as repairs RP-458 through RP-473 on *Repair Log*
    - GCL underneath geomembrane liner along southern end SA-6 (swale) hydrated from rainwater accumulating outside of cap due to subgrade (subgrade outside of the cap not final) and failure of sump pump in area during storm. Geomembrane liner pulled back and cut to remove and replace sections of GCL. These patches were noted as a subgrade irregularities and were completed following project specs and are further defined on *Sheet 9 Notice of Non-Compliance*
- Non-Conformance No. 10 (Sheet #10) – Subgrade irregularity (hydrated GCL) identified as RP-474 and RP-475 on *Repair Log*
    - GCL underneath geomembrane liner along northern end of SA-6 cap (along SCB wall) hydrated from rainwater accumulating outside of cap due to subgrade (subgrade outside of the cap not final). Geomembrane liner pulled back and cut to remove and replace sections of GCL. These patches were noted as a subgrade irregularities and were patched/repaired following project specs as further defined on *Sheet 10 Notice of Non-Compliance*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 10/7/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 3 wells, 4 piezometers, and 7 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), Main Access Manhole #3 (located at western slope of 2$^{nd}$ utility corridor), and Manhole #4.
- Review laboratory data for destruct samples DS-28 and DSX-12.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, 9/22/15, 9/23/15, 9/24/15, 9/25/15, and 9/29/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-27, and DSX-1 through DSX-11. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas along far eastern end of SA-6. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | | **DATE:** | 10/08/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 62/77° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | | **TIME:** | 0630 – 1830 |

| **CONTRACTOR & EQUIPMENT:** | **PERSONNEL ON SITE:** **Day #36** |
|---|---|
| **ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **AmecFW**: Stu Bills, Brian Shea, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geosynthetic clay liner (GCL), geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing along eastern side of 3rd utility corridor. Material to be placed from Panel #125 installed on 9/29/15 (located at approximate Sta. 2+50) running approximately 100 ft. east to Sta. 1+50.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI deploying rolls of GDL from Panel #118 (approximate Sta. 3+80) to approximate Sta. 2+50 (Panel #125). GDL was placed according to project specifications with white plastic fasteners spaced at a maximum of 5 ft., and top layer of geotextile sewn along the panel seams.
- While ESI was placing GDL, Langan and Entact conducted soil subgrade approval from east of Panel #125 (located at approximate Sta. 2+50) to approximate Sta. 1+50. Refer to *Soil Subgrade Approval* forms from 10/08/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3 and #4 of the daily photo log for 10/08/2015, for supporting subgrade photos (along with GCL placement). This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 2+50 to Sta. 1+50.
- GVL and Cap placement began with ESI placing the GCL along the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The GCL was overlapped approximately 2 ft. outside of the cap and was placed along the areas below (to 1 ft. above) the water table (as shown on the drawings and outlined in the project specs). This included the remaining area within the SA-6, as the lower bench east of Sta. 2+50 was comprised of areas below the water table elevation. GCL was overlapped a minimum of 1 ft. along the seams with granular bentonite placed along the edges (as outlined in the project specs).
- Upon placement of the GCL, GVL was placed along the upper elevations within the areas outside of the water table influence (as shown on the project drawings). GVL was placed according to project

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

specifications with white plastic fasteners spaced at a maximum of 5 ft. intervals and the top layer of geotextile sewn.

- After installation of the GCL and GVL, geomembrane cap was installed continuing east of previously installed Panel #125 on 9/29/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GCL and GVL layers. A total of ten varying panel lengths were placed by ESI (Panels #126-134). Note: the dimensions of these panel lengths varied as the geomembrane panels were conformed to fit along the eastern end of the SA-6 cap.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to the project specifications). Prior to welding activities, three trial welds (smooth to smooth, smooth to texture, and texture to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (10/8), *Trial Weld Log.*
- Upon completion of geomembrane panel placement to approximate Sta. 1+50, ESI conducted non-destructive testing in accordance with the project specifications. Refer to *Seam Control Form* (10/08/15) for non-destructive testing details. Once, non-destructive testing was completed, ESI then conducted minor patch/ repair work for the panels installed (pipe boots PZ-12).
- A total of one repair (RP-476) was completed (according to the project specifications) for Panel #132 (pipe boot PZ-12). Refer to 10/8/15 *Repair Report* for additional details on the pipe boot. Note: no non-compliance issues were observed during the geomembrane placement and testing conducted on 10/8/15.
- One destructive sample was collected from 10/8/15. Destruct sample DS-29 (fusion) was collected from Panel #128/132 seam.
- During cap placement activities, Entact continued to spread protective cover soil for the area through the 3rd utility corridor (approximate Sta. 6+80, moving east). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project and patch / repair work completed consisted of pipe boot installations around PZ-12.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 10/8/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 3 wells, 5 piezometers, and 8 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70), Main Access Manhole #3 (located at western slope of 2$^{nd}$ utility corridor), and Manhole #4.
- Review laboratory data for destruct samples DS-29.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, 9/22/15, 9/23/15, 9/24/15, 9/25/15, 9/29/15, and 10/07/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-28, and DSX-1 through DSX-12. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for remaining areas along far eastern end of SA-6. Ensure subgrade is graded, compacted, and free of debris, as well as surveyed to specifications.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** | Honeywell International, Inc. | **DATE:** | 10/09/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 58/75° F, Clear, Overcast, PM T'Storm |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 0630 – 1730 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #37**
**AmecFW**: Stu Bills, Brian Shea, Ari Eslaminejad
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite drainage layer (GDL) continuing along eastern side of 3rd utility corridor, and to eastern end of SA-6, and patch / repair work associated with panels placed from 10/8/15 (Panels #126-134).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI completing patch / repair work for panels previously placed on 10/8/15 (Panels #126-134). A total of nine repairs (RP-477 through RP-485) were observed and fixed (according to the project specifications) from Panels #126 through Panel #134. Refer to 10/9/15 *Repair Report* for additional details. The majority of these repairs were custom fit details (allow the geomembrane to conform to the SA-6 contours) or seam joint repairs (joints where non-destructive testing was completed). Repairs were patched, sealed with an extrusion weld, and vacuum box tested (according to project specs).
- Two destructive samples were collected from 10/9/15. Destruct sample DSX-13 (extrusion) was collected from RP-477 (Panel #125) and DSX-14 (extrusion) was collected from RP-480 (Panel #132).
- Upon completion of the patch / repair work, ESI completed the final monitoring well, piezometer, and gas vent boots by placing the final butyl sealant around the top of the boot. Additionally, 1-inch pipe bands were placed around the conical Access Manholes (as per project specs).
- With the pipe boots completed, ESI deployed GDL from Panel #125 to Panel #134 (panels placed on 10/9/15). GDL was placed according to project specs with white plastic fasteners spaced at a maximum of 5 ft. and the top layer of geotextile sewn.
- Note: As per the AmecFW GDL Cover Soil Siltation Evaluation and Mitigation Measures Memo (Memo) submitted October 26, 2015, three areas in the field were identified where GDL was exposed and silts were deposited directly onto the GDL. In response to the protective cover soil siltation, three new pieces of GDL were placed directly over the potentially impacted areas to assist in drainage. Additional details of these areas and mitigation measures are further described in the AmecFW Memo, with supporting photographs provided.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- During cap placement activities, Entact continued to spread protective cover soil for the area through the 3rd utility corridor (approximate Sta. 6+80, moving east). Protective cover soil was placed following the project specs with warning caution tape spaced at maximum of 55-inch intervals.
- Upon completion of the daily activities, ESI demobilized from the Site, as SA-6 capping activities were completed.

***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as patch / repair work completed consisted of custom fit repairs and seam joint patches to allow the geomembrane to conform to the SA-6 contours.

***Action Items – Pending***

- Complete Daily Report and Photo Log (for 10/9/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Well / Piezometer Penetration Logs (for 3 wells, 5 piezometers, and 8 gas vents).
- Complete Collection Manhole Penetration Logs for Manhole #1, and Manhole #2, Main Access Manhole #3 (located at western slope of 2nd utility corridor), and Manhole #4.
- Review laboratory data for destruct samples DSX-13 and DSX-14.

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, 9/22/15, 9/23/15, 9/24/15, 9/25/15, 9/29/15, 10/07/15, and 10/08/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-29, and DSX-1 through DSX-12. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue with protective cover soil placement along eastern end of SA-6.
- Ensure destruct samples are in compliance with project specs and complete associated paperwork and construction certification report.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** | Honeywell International, Inc. | **DATE:** | 10/12/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 72° F, Clear |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 1520 – 1720 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #38**<br>**AmecFW**: Stu Bills, Dave Ambrose, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of patch / repair work associated with a failed destruct test (DSX-13) for RP-477 located on Panel #125.
- Based on results of the laboratory destruct testing, 1 of 5 specimens exhibited a peel value less than the 66 lb/in value allotted (as per the project specs) for destruct sample DSX-13. Based on this one failure anomaly, the repair associated with DSX-13 (RP-477) was covered with a new patch, welded, and vacuum box tested (as per project specs). In addition, a new destruct sample DSX-15 was collected to confirm the integrity of the new welds associated with the new patch. Note: the average of the 5 peel specimens complied with the project specs (total of 92 lb/in).
- Site activities commenced with ESI completing patch / repair work for RP-477. A new 5 ft. by 15 ft. patch was placed over the repair, sealed with an extrusion weld, and vacuum box tested as per project specs. Once the new repair (RP-487) was complete, a new destruct sample, DSX-15, was collected to confirm the integrity of the weld.
- One destructive sample was collected from 10/12/15. Destruct sample DSX-15 (extrusion) was collected from RP-487 (placed over RP-477). Subsequent laboratory testing yielded peel and shear values that were in compliance with the project specs.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 11 (Sheet #11) – Failed destruct sample (DSX-13) collected from RP-477 from Panel #125 (failed one of the five specimens for peel testing)
    - Geomembrane patch was placed over RP-477, welded, and vacuum box tested (as per project specs). Additionally, a new destruct sample (DSX-15) was collected from the new patch (RP-487) to confirm the integrity of the new weld. This repair was noted as a failed destruct sample and was completed following project specs and as further defined on *Sheet 11 Notice of Non-Compliance.*

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Pending***

- Complete Daily Report and Photo Log (for 10/12/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Review laboratory data for destruct samples DSX-15.

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, 8/10/15, 8/12/15, 8/13/15, 8/15/15, 9/9/15, 9/11/15, 9/14/15, 9/15/15, 9/16/15, 9/17/15, 9/18/15, 9/21/15, 9/22/15, 9/23/15, 9/24/15, 9/25/15, 9/29/15, 10/07/15, 10/08/15, and 10/09/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-29, and DSX-1 through DSX-14. Laboratory results in compliance with shear and peel requirements as outlined in project specifications with the exception of DSX-13. Subsequent patch / repair work defined within this report for the failed destruct sample.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Ensure new destruct sample (DSX-15) adheres to project specifications. Subsequent review of the data yielded peel and shear values that were in compliance with the project specs.
- Complete associated paperwork and begin construction certification report.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** | Honeywell International, Inc. | **DATE:** | 11/04/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 55 / 70° F, Clear |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** | Geocomposite & Cap Placement | **TIME:** | 0845 – 1215 |

| **CONTRACTOR & EQUIPMENT:** | **PERSONNEL ON SITE:** **Day #39** |
|---|---|
| **ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **AmecFW**: Stu Bills, Dave Ambrose, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of patch / repair work associated with an equipment puncture that was observed along the northern end of SA-6 (at SCB wall) at approximate Sta. 2+95.
- Based on conversations with the project team, it is understood that during final grading of the area, the tooth of an excavator bucket punctured the GDL and underlying geomembrane cap. This error was attributed to malfunctioning GPS equipment, as the SCB wall (outside of the Cap) was not programmed into the GPS.
- Site activities commenced with ESI completing patch / repair work at the puncture location (along edge of SCB wall at approximate Sta. 2+95. A new piece of GCL was initially placed over the puncture area and a 2 ft. by 1.5 ft. geomembrane patch was then placed over the puncture, and sealed with an extrusion weld (as per project specs). Vacuum box testing could not be completed by ESI, as the patch / repair was located right on the edge of the SCB wall (refer to supporting photo log from 11/4/15).

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 12 (Sheet #12) – Equipment puncture through geomembrane cap.
    - Geomembrane patch was placed over equipment puncture along SCB wall (at approximate Sta. 2+95) and extrusion welded (as per project specs). Prior to patch / repair work, a new piece of GCL was placed over the puncture. This repair was noted as an equipment puncture and was completed following the project specs and as further defined on *Sheet 12 Notice of Non-Compliance.*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 11/04/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).

Mark with an 'X' to designate hazardous materials as defined in title 49 of the code of Federal Regulations. Received Subject to the classifications and lawfully filed tariffs in effect on the date of issued of this billing of lading, the properly described above in apparent good order, expect as noted (contents and conditions of contents of packages unknown) marked, consigned, and destined as indicated above which said carrier (the word carrier being understood throughout this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery at said destination, if on its route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed as to each carrier of all or any of the said property over all or any portion of the said route to destination , and as to each party at any time interested in all or any said property, that every service to be performed hereunder shall be subject to all the terms and conditions of the Uniform Domestic Stright Bill of Lading set forth (1) in Uniform Freight Classifications in effect on the date hereof, if this is a rail or a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment.
Shipper hereby certifies that he is familiar with all the terms and conditions of the said bill of lading, set forth in the classification of tariff which governs the transportation of this shipment, and the said terms and conditions are hereby agreed to by the shipper and accepted for himself and his assigns.

**Carrier:**

This is to certify that the above named materials are properly classified, described, packaged, and labeled and are in proper condition for transportation according to the applicable regulations of the department of Transportation.

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns.

**CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY**

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed hereunder shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for Truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be performed hereunder between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this is a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries. Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns.

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns.

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns.

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns.

# TRAIGHT BILL OF LADING - SHORT FORM - ORIGINAL - NOT NEGOTIABLE

B/L NO. 046962

AME OF CARRIER: BEST WAY FRT LTL | CARRIER'S NO. | DATE: 7/16/2015

CEIVED, subject to the classifications and lawfully filed tariffs in effect on the date of issue of this Bill of Lading,
property described below, in apparent good order, except as noted (contents and condition of contents of packages unknown), marked, consigned, and destined as indicated below which said carrier (the word carrier beir
derstood throughout this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery at said destination, if on its route, otherwise to deliver t
other carrier on the route to said destination. It is mutually agreed as to each carrier of all or any of said property over all or any portion of said route to destination, and as to each party at any time interested in all or any
d property, that every service to be performed hereunder, shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Uniform Freight Classifications in effect on the da
reof, if this is a rail or a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment.
ipper hereby certifies that he is familiar with all the terms and conditions of the said bill of lading, set forth in the classification or tariff which governs the transportation of this shipment, and the said terms and conditior
hereby agreed to by the shipper and accepted for himself and his assigns.

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries. Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries. Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns.

CARRIER MUST COLLECT THE FREIGHT FROM THE BROKER ONLY

Received at Commerce, GA from SKAPS Industries the property described above, in apparent good order except as noted (contents and condition of packages unknown), marked, consigned, and destined as indicated above, which said Carrier (the word "Carrier" being understood throughout this Shipping Order as meaning the person or corporation in possession of the property) agrees to carry to the place of delivery at said destination. It is mutually agreed as to each Carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any of said property, that every service performed here under shall be subject to either: (a) if the shipper noted herein is SKAPS Industries as indicated by the designation of the "Shipper" to be SKAPS Industries, then the Shipper and Carrier are subject to the terms and conditions contained in the Contract for truck Transportation existing between the parties or (b) if the Shipper noted herein is not SKAPS Industries then SKAPS Industries is acting solely as the agent for the denoted Shipper, and thus every aspect of the service to be perform here under between the Shipper and the Carrier shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Official Southern, Western, and Illinois Freight Classifications in effect on the date hereof, if this a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor carrier shipment. When acting in the capacity of an agent for a Shipper in placing the material in transit on behalf of a Shipper, SKAPS Industries accepts no liability for loss of cargo, damage to containers, or any other consequences occurring during transportation. Carrier having agreed that the transportation arrangement was initiated by the Shipper and not by SKAPS Industries Subject to the above terms and conditions as to which party is the Shipper, Shipper hereby certifies that he is familiar with the terms and conditions that govern the transportation of this shipment, and the said terms and conditions are hereby agreed and accepted for himself and his assigns.

| STA | FINAL SCB WALL ELEVATION |
|---|---|
| 0+00 TO 3+22 | 8.75 FEET |
| REMAINING LENGTH | SCB WALL TO BE CUT AT LINER GRADE BUT IN NO CASE SHALL SCB WALL BE CUT LOWER THAN 0.75 FEET ABOVE THE PERIMETER POOL ELEVATIONS |

(SEE SHEET C-121 FOR AREAS BELOW HISTORIC GROUNDWATER TABLE)

TYPICAL CAP COMPONENTS BELOW GROUNDWATER (G) TYP | C-309
NTS

***Check applicable Detail:**

- ☑ Box Cut Dimension
- ☑ Barrier wall clean/exposed
- ☑ Sand Bentonite Mix

**Location:**

- **Soil Cement Bentonite Wall stations 0+00 to 2+50 (approximately).**

**Comments:**

- Rolls #4071 and #4102 were placed over the SCB Wall.

## Repair Report

**Project Name** Honeywell **Job # :** 12-11-1399 **Superintendent:** Fortino Ayala

**Material Type:** LLDPE 60 MIL DST **Primary** **Pond**

**Job Description:** Cap Single Layer **Secondary** **Cell**

**Reported by :** Lyssa Tran **Cap** x

**Other:** Cap construction

| Damage Codes | | | | | | |
|---|---|---|---|---|---|---|
| CR --Crease | FS --Failed Seam | MatD --Material Defect | LL --Lost Lap | CF --Custom Fit |
| DS --Destruct Sample | WR --Wrinkle | WS --Welder Restart | MD --Mechanical Damage | PB --Pipe Boot |
| SI --Subgrade Irregularity | AV --Airvent | RW --Roller Wrinkle | DO --Damage By Others | BO --Burn Out |
| SJ --Seam Joint | AO --Add On | CS --Concrete Structure | | AT -Air Test |
