# EXECUTIVE SUMMARY

Honeywell is submitting this Construction Completion Report (CCR) pursuant to the First Amended Consent Decree Regarding the Remediation and Redevelopment of Study Area 6 South, ECF No. 434, entered by the United States District Court, District of New Jersey on August 2, 2012, in Civil No. 05-05955, later consolidated with Civ. No. 95-2097 ("SA-6 South Consent Decree") in order to document the Chromium Remedy implemented to address chromium-impacted soil site-wide and groundwater for the Open Space Area of Concern (AOC) at Study Area 6 South ("SA-6 South"), located in Jersey City, Hudson County, New Jersey. The remedial activities were initiated in March 2013 and were completed in November 2016. A Remedial Action Report (RAR) was prepared by Honeywell and submitted to New Jersey Department of Environmental Protection (NJDEP). NJDEP approved the RAR on March 30, 2017.

The Chromium Remedy was implemented successfully in accordance with the following:

- NJDEP-approved Remedial Action Work Plans;
- SA-6 South Consent Decree, the SA-6 South 100% Design Report and Design Change Bulletins;
- NJDEP's Technical Requirements for Site Remediation; and
- NJDEP's Administrative Requirements for the Remediation of Contaminated Sites.

SA-6 South encompasses approximately 25 acres along Kellogg Street between Route 440 and the Hackensack River. For this CCR, the contaminant of concern (COC) in soils at SA-6 South is hexavalent chromium and the COC for shallow groundwater is total chromium per the NJDEP-approved RAWPs. Deep overburden and bedrock groundwater zones are being addressed by the Study Area 7 (SA-7) regional groundwater remedy. SA-6 South consists of three AOCs, as shown on **Figure 19**, with respect to chromium:

- Kellogg Street Development AOC;

- Site 163 Development AOC[1]; and
- Open Space AOC.

The Remedial Action Objectives (RAOs) established in the NJDEP-approved RAWPs for the SA-6 South AOCs are as follows:

The RAOs for soils include:

- Prevent exposure to chromium-impacted soils[2] containing hexavalent chromium above the NJDEP soil criteria of 20 milligrams per kilogram (mg/kg) to a depth of 20 feet, consistent with NJDEP policy.
- Remove and consolidate chromium-impacted soils that may be disturbed by future Site redevelopment activities; and reuse soils beneath area to be capped, to the extent feasible.
- Coordinate remedial actions for chromium with remedial actions for non-chromium contaminants and Site redevelopment, to the extent feasible.

RAOs for groundwater include:

- Mitigate the potential for surface water infiltration and leaching of contaminants (total and hexavalent chromium) from fill soils (vadose zone) to groundwater.

---

[1] The Site 163 Development AOC is comprised of two areas, the Deed Notice Area and the Non-Deed Notice Area. The remediation differed in the two areas of the Site 163 Development AOC. In the Deed Notice Area, chromium-impacted soils were excavated only to 4 feet below ground surface (bgs), leaving chromium-impacted soils at concentrations exceeding 20 mg/kg deeper than 4 feet bgs in place. The Deed Notice Area will be subject to a deed notice and conservation restriction, like the Open Space AOC. Residential development is prohibited in the Deed Notice Area. In the Non-Deed Notice Area, chromium-impacted soils at concentrations exceeding 20 mg/kg were excavated to a depth of 20 feet bgs or to the meadow mat, as discussed in Section 8.

[2] Throughout this CCR reference to chromium-impacted soils shall mean soils containing hexavalent chromium above the NJDEP soil criteria of 20 mg/kg and reference to chromium-impacted groundwater shall mean groundwater with total chromium above the NJDEP groundwater standard of 70 µg/L.

- Mitigate offsite migration of chromium in groundwater above the NJDEP Groundwater Quality Standard (GWQS). ).[3]
- Reduce chromium concentrations in groundwater.
- Prevent exposure to groundwater chromium concentrations above the NJDEP GWQS.

Remediation was completed across SA-6 South in order to meet the RAOs, with the exception of two areas where remediation has been deferred ("Deferred Areas") as shown on **Figure 19**:

- Bulkhead area along the western perimeter of SA-6 South ("Site 073 Bulkhead Deferred Area"); and
- Route 440 right-of-way along part of the eastern perimeter of SA-6 South ("Route 440 ROW Deferred Area").

Therefore, other than remediation in the identified Deferred Areas, no further remedial actions are required for SA-6 South other than actions to support the long-term maintenance and operation requirements for shallow groundwater and the deed noticed areas where chromium-impacted soils remain, including the Open Space AOC and the Site 163 Development AOC Deed Notice Area. Remediation of the Deferred Areas will be coordinated with the Bayfront Redevelopment Project and the widening of Route 440.

Major activities associated with the Chromium Remedy included:

- Excavation and offsite disposal of approximately 22,400 cubic yards (CYs) of chromium-impacted soil from the Kellogg Street Development AOC and the Site 163 Development AOC Non-Deed Notice Area;

[3] The SA 6 South Consent Decree requires Honeywell to isolate shallow groundwater and to intercept and treat shallow groundwater flowing above the meadow mat in the Open Space AOC to the extent that such groundwater contains total chromium in concentrations in excess of 70 µg/l. The Study Area 6 South Consent Decree also requires Honeywell to maintain an outward gradient of shallow groundwater from Study Area 7.

- Excavation and offsite disposal of approximately 23,000 CYs of petroleum-impacted soil co-mingled with chromium-impacted soil from the Kellogg Street Development AOC;
- Excavation of approximately 59,000 CYs of chromium-impacted soil from the Kellogg Street Development AOC and the Site 163 Development AOC (referred to together as "Development AOCs") and consolidation of this material in the Open Space AOC;
- Reuse of approximately 46,000 CYs of confirmed non-chromium-impacted historic fill soils as backfill in excavations;
- Placement of approximately 217,000 CYs of clean fill material as supplemental backfill in excavations;
- Surcharging of the Open Space AOC to consolidate underlying compressible strata;
- Construction of approximately 2,586 feet of hydraulic barrier around the Open Space AOC;
- Construction of an approximately 8-acre Resource Conservation and Recovery Act (RCRA) cap in the Open Space AOC; and
- Construction of a 1,700-foot long contingent groundwater extraction system within the Open Space AOC.

Prior to and during the development of the 100% Design, Pre-Design Investigation (PDI) sampling and analytical activities were completed to delineate the lateral and vertical limits of hexavalent chromium concentrations to 20 mg/kg in soils at SA-6 South. The PDI samples were considered post-excavation equivalent samples that precluded the need for collection of traditional post-excavation confirmatory samples at the completion of excavation activities for most of the site. Additional post-excavation sampling was required to confirm excavation limits upon encountering isolated incidences of anomalous material under the office portion of the 60 Kellogg Street building south of the 20 mg/kg line delineated during the PDI, and along isolated locations of excavation sidewalls or bottoms at Sites 073, 125, 134, and 140 as documented in Section 8.6. Other than these instances, the PDI allowed the remedial action to be more definitively designed and implemented in the field and is a process that has been accepted by the NJDEP in the RAWP and has been implemented successfully by Honeywell at other sites. The results of the PDI are

contained in Appendix A, Pre-Design Investigation Summary Report (PDI Report), of the SA-6 South Chromium Remedy 100% Design Report.

In addition, pursuant to the SA-6 South 100% Design Report, an in-situ treatment program involving injections of a chemical reductant was conducted within the Site 163 Development AOC to treat chromium-impacted soils at isolated locations. The in-situ injections were ineffective in achieving hexavalent chromium detections of <20 mg/kg at all depths. As a result, full excavation of chromium-impacted soils was conducted in the Site 163 Development AOC Non-Deed Notice Area. In the Site 163 Development AOC Deed Notice Area, chromium-impacted soils were excavated to a depth of 4 feet bgs, and chromium-impacted soils at a depth below 4 feet bgs were left in place and capped with clean soil and gravel.

During excavation activities in the Kellogg Street Development AOC, numerous unforeseen subsurface features, conditions, or structures were encountered and managed in accordance with NJDEP requirements.

The RAOs for soils in the Kellogg Street Development AOC were met by implementation of excavation in accordance with the SA-6 South 100% Design Report. The RAOs for soils in the Site 163 Development AOC are being met by a combination of excavation and capping that has been completed and institutional controls (deed notice and conservation restriction) that will be established in 2017. The RAOs for soils in the Open Space AOC are being met by a combination of a RCRA cap that has been completed and institutional controls (deed notice and conservation restriction) that will be established (deed notice) and/or updated (conservation restriction) in 2017.

It is anticipated that RAOs for SA-6 South shallow groundwater in the Development AOCs will be met as a result of the removal of chromium-impacted soil from the Development AOC and containment and capping of chromium-impacted soils and groundwater in the Open Space AOC. Preliminary sampling following the completion of the excavation remedy shows groundwater results below the GWQS for total chromium. This will be confirmed by post-remediation shallow groundwater sampling, which will be implemented in the Development AOCs in accordance with a Long Term Monitoring Plan (LTMP) currently being prepared for SA-6 North and SA-6 South. Further, the LTMP establishes procedures and schedules for long-term monitoring of shallow groundwater quality and levels in the

Open Space AOC to determine the potential operation of the contingent groundwater extraction system. The LTMP also establishes the inspection, maintenance, and operation of critical features of the Chromium Remedy.

Honeywell will establish appropriate institutional controls at SA-6 South that supplement the remedial actions. These include: deed notices and a remedial action permit for soils for four distinct areas: the Open Space AOC, the Site 163 Development AOC Deed Notice Area, and the two Deferred Areas; a conservation restriction for the Site 163 Development AOC Deed Notice Area; and a remedial action permit for shallow groundwater in the Open Space AOC. A conservation restriction has already been established for the Open Space AOC and will be updated to reflect the final as-built boundaries of the Open Space Area. A classification exception area (CEA) has already been established with the NJDEP for the regional shallow groundwater, but Honeywell may revise the boundary of the shallow groundwater CEA slightly based upon post-remediation shallow groundwater results from the Development AOCs.

It is Honeywell's intention that this document will close out remediation of chromium-impacted soils at SA-6 South with the exception of the implementation of the institutional controls and remediation of the Deferred Areas. Honeywell will subsequently request review and approval of similar documents to close out remediation of chromium-impacted shallow groundwater in the Development AOCs once groundwater sampling confirms that the RAOs have been met and the remediation of chromium-impacted soils in the Deferred Areas.

# 1.0 INTRODUCTION

## 1.1 PURPOSE AND SCOPE

Honeywell International Inc. (Honeywell) is submitting this Construction Completion Report (CCR) prepared by Amec Foster Wheeler Environment and Infrastructure, Inc. (Amec Foster Wheeler) to document completion of remedial activities associated with the Chromium Remedy at Study Area 6 South (SA-6 South), located in Jersey City, Hudson County, New Jersey. A Site Location Map is included as **Figure 1**. This CCR was prepared for and is submitted solely to the Special Master, the Parties, and the Court pursuant to the First Amended Consent Decree Regarding the Remediation and Redevelopment of Study Area 6 South, ECF No. 434, entered by the United States District Court, District of New Jersey on August 2, 2012, in Civil No. 05-05955, later consolidated with Civ. No. 95-2097 ("SA-6 South Consent Decree"). [4]

A Remedial Action Report (RAR)was prepared by Honeywell and submitted to the New Jersey Department of Environmental Protection (NJDEP) in accordance with the remedial action reporting requirements specified in the Technical Requirements for Site Remediation (TRSR), (New Jersey Administrative Code [N.J.A.C.] 7:26E-5.7). Since NJDEP's Site Remediation Program Case Management Team retained direct oversight of the Chromium Remedy, Honeywell requested NJDEP review and approval of the RAR in accordance with paragraph 23, G of the Consent Judgment between Honeywell and the NJDEP dated September 7, 2011 ("Consent Judgment"). NJDEP approved the RAR on March 30, 2017.

The purpose of this CCR is to provide documentation of the successful execution of the Chromium Remedy at SA-6 South to address chromium-impacted soil and

[4] The "Parties" referenced in this CCR are the signatories to the SA-6 South Consent Decree: the City of Jersey City, Hackensack Riverkeeper, and Honeywell. In addition, the "Special Master" referenced in this CCR is the Honorable Senator Robert Torricelli, who was appointed pursuant to the SA-6 South Consent Decree, paragraph 85, to oversee and enforce the implementation and long-term monitoring of the Chromium Remedy within SA-6 South, and the Initial Development Period related to the Open Space AOC.

groundwater[5]. The Chromium Remedy was completed in three Area of Concerns (AOCs) as shown on Figure 19:

- Kellogg Street Development AOC,
- Site 163 Development AOC[6], and
- Open Space AOC.

The Chromium Remedy was implemented at SA-6 South in accordance with the following documents:

- An Administrative Consent Order ("ACO") between Honeywell, formerly Allied Signal, Inc., and the NJDEP (NJDEP, 1993), modified pursuant to the Consent Judgment;
- SA-6 South Consent Decree;
- July 1, 2013: Technical Requirements for Site Remediation N.J.A.C. 7:26E-1-5 adopted May 7, 2012, revised 2013;
- NJDEP, 2012. New Jersey Administrative Code, Chapter 26C Administrative Requirements for the Remediation of Contaminated Sites (ARRCS); last revised May 7, 2012, Trenton, New Jersey.
- December 23, 2008: *Supplemental Remedial Investigation Report, Remedial Action Selection Report, and Remedial Action Work Plan for Chromium* to address chromium contamination at SA-6 South, exclusive of Site 163 (SA-6

[5] Throughout this CCR, reference to chromium-impacted soils shall mean soils containing hexavalent chromium above the NJDEP soil criteria of 20 mg/kg, and reference to chromium-impacted groundwater shall mean groundwater total chromium above the NJDEP groundwater standard of 70 µg/l.

[6] The Site 163 Development AOC is comprised of two areas, the Deed Notice Area and the Non-Deed Notice Area. The remediation differed in the two areas of the Site 163 Development AOC. In the Deed Notice Area, chromium-impacted soils were excavated only to 4 feet below ground surface (bgs), leaving chromium-impacted soils at concentrations exceeding 20 mg/kg deeper than 4 feet bgs in place. The Deed Notice Area will be subject to a deed notice and conservation restriction, like the Open Space AOC. Residential development is prohibited in the Deed Notice Area. In the Non-Deed Notice Area, chromium-impacted soils at concentrations exceeding 20 mg/kg were excavated to a depth of 20 feet bgs or to the meadow mat, as discussed in Section 8.

South Chromium SRIR/RASR/RAWP). This document was approved by the NJDEP in a letter dated March 24, 2009.

- May 18, 2012: *Supplemental Remedial Investigation Report, Remedial Action Selection Report, and Remedial Action Work Plan,* to address chromium contamination at Site 163 only (Site 163 Chromium SRIR/RASR/RAWP). This document was approved by the NJDEP in a letter dated June 22, 2012.
- June 28, 2013: *Chromium Remedy 100% Design Report - Issued for Construction* for SA-6 South, ECF Nos. 1176 and1180, entered by the United States District Court, District of New Jersey on July 10, 2013, in Civ. No. 05-05955, later consolidated with Civ. No. 95-2097 ("SA-6 South 100% Design Report"). Portions of this document were reviewed and approved by the NJDEP in an email on May 15, 2013. The Design Report for SA-6 North was issued at the same time and contains some information in the Appendices that also applies to SA-6 South. Unless otherwise noted, the design report, drawings, and specifications are collectively referred to herein as the 100% Design Report.
- Design Change Bulletins (DCs) to SA-6 South 100% Design Report as indicated in Section 3 below.

As the Chromium Remedy progressed, Honeywell prepared a series of Declarations which were periodically submitted to the Parties to memorialize completion of specific remedial elements of the Chromium Remedy in accordance with the above documents. There are three individual Declarations related to SA-6 South (Declarations Nos. 1, 2 and 5), and five in total for SA-6 South and SA-6 North. In general accordance with Honeywell correspondence dated June 19, 2014 and February 4, 2016 submitted to all Parties, the elements of each Declaration were as follows:

- Declaration No. 1: Excavation and backfilling, hydraulic barrier wall construction, and soil management and disposition at SA-6 South;
- Declaration No. 2: Open space cap subgrade, geosynthetic components, contingent groundwater extraction system trench construction, and trimming of the hydraulic barrier wall sheet pile to final elevation at SA-6 South;
- Declaration No. 3: Excavation and backfilling, hydraulic barrier wall construction, and soil management and disposition at SA-6 North;

- Declaration No. 4: Open space cap subgrade, geosynthetic components and contingent groundwater extraction system trench construction at SA-6 North; and
- Declaration No. 5: All Remaining construction activities including: additional miscellaneous excavations at SA-6 South within 60 Kellogg and Site 163; installation of gas vent system, cover soil placement, final contingent groundwater extraction system infrastructure installation, discussion of deferred areas and pending institutional controls required, in-situ treatment, soil erosion and sediment control at SA-6 South and SA-6 North; monitoring well installation and abandonment, final grading and historic fill cap installation at SA-6 South; and meadow mat (Stratum D) repair at SA-6 North .

In addition, each Declaration is signed by Honeywell and a New Jersey-licensed professional engineer and all five Declarations have been entered with the United States District Court for the District of New Jersey in Civil No. 95-2097 (see ECF Nos. 1403-1, 1464-1, 1484, 1487, and 1515, for Declarations 1 through 5, respectively). While the Declarations are not required by the TRSR for RARs, the Special Master and Parties have agreed that the Declarations will be included in the CCR. As a result, the Declarations are attached to this CCR (**Appendix S**). The CCR will be filed with the Court in accordance with paragraph 5 of the Consent Order Entering Consolidated 100% Design for Study Area 6 North and Study Area 6 South, *Jersey City Municipal Utilities Auth. v. Honeywell*, D.N.J., Consol. Cases, Civ. No. 95-2097, July 9, 2013, ECF No. 1180.

Non-chromium areas of concern (AOCs) within SA-6 South were also remediated during the implementation of the Chromium Remedy. This CCR does not address non-chromium AOCs. A separate RAR addressing the SA-6 South non-chromium AOCs was prepared and submitted to NJDEP by Honeywell's Licensed Site Remediation Professional (LSRP) in December 2016. A separate RAR for chromium remediated at SA-6 North was submitted to NJDEP, the Special Master, and the Parties on March 16, 2017. NJDEP approved the SA-6 North RAR on June 1, 2017. A CCR for SA-6 North will be prepared and submitted solely to the Special Master and the Parties.

The SA-6 Chromium Remedy 100% Design was prepared by Honeywell as one integrated project for both SA-6 North and SA-6 South. The 100% Design Report was used to obtain bids from and select a remedial contractor to implement the Chromium Remedy at both sites concurrently with the same project team under one contract. Although two 100% Design Reports were prepared for SA-6 North and SA-6 South, remedial activities or elements that were common to each were combined to the extent possible. Project execution followed the integrated approach with certain elements of the SA-6 Chromium Remedy common to both sites, such as project support systems and infrastructure, construction water treatment, decontamination pads, site security and preparation, etc.

## 1.2 SITE SETTING AND SITE HISTORY

SA-6 North and SA-6 South are located on the west side of Jersey City. SA-6 North and SA-6 South are separated by Study Area 7 (SA-7). SA-6 North, SA-6 South, and SA-7 lie between Route 440 to the east and the Hackensack River to the west. A Site Layout Map is included as **Figure 2.** SA-6 South is bordered by SA-7 to the north and Droyers Cove, Kellogg Street and Droyers Point Society Hill developments to the south. Adjacent commercial properties, including New Jersey City University (NJCU) and a Home Depot, are located east of Route 440.

Collectively, SA-6 North, SA-7, and SA-6 South comprise approximately 100 acres (see **Illustration 1**). Bayfront Redevelopment LLC, a wholly owned subsidiary of Honeywell, owns both the SA-6 North and SA-6 South properties with the exception of: (a) Lot 4, a 0.4-acre lot that is owned by Mr. Paul Trenk, and (b) Block 6 on SA-6 North, representing a 6.25-acre lot occupied by the Jersey City Municipal Utilities Authority (JCMUA), and the City of Jersey City (Jersey City). All lots and blocks on SA-6 South are owned by Bayfront Redevelopment LLC and total just over 25 acres as indicated below.

SA-6 South is comprised of the following six sites:

| NJDEP Site No. | NJDEP Site Name | Program Interest Number for Chromium | Block 24601 Lot No. | Address | Acres |
|---|---|---|---|---|---|
| 073 | Degen Oil | G000000927 | 1 | 200 Kellogg St. | **3.19** |
| 124 | Roosevelt Bowling Lanes | G000008741 | 8 & 12 | 427 Route 440 | **3.65** |

| NJDEP Site No. | NJDEP Site Name | Program Interest Number for Chromium | Block 24601 Lot No. | Address | Acres |
|---|---|---|---|---|---|
| 125 | Delphic Consolidated | G000008742 | 7 | 60 Kellogg St. | **2.99** |
| 134 | Old Dominion | 033312 | 3, 4, & 5 | 100 Kellogg St. | **4.82** |
| 140 | ABF Trucking | 003846 | 6 | 80 Kellogg St. | **3.67** |
| 163 | Posnak & Turkish | 010374 | 11 | 75 Kellogg St. | **4.97 (of which 2.58 is submerged)** |
| Included in 124 | Cordova | NA | 9 & 10 | 28 & 38 Kellogg St. | **1.2** |
| Included in 134 | Boatyard | NA | 2 | 150 Kellogg St. | **0.89** |
| **Total Acres** | | | | | **25.38** |

Detailed site histories have been provided in previous regulatory submittals. Recent operations at SA-6 South and SA-6 North are summarized as follows:

- SA-6 North is also referred to as the "Jersey City Properties." Since approximately the mid-1950s, the SA-6 North was owned by Jersey City and occupied by "Jersey City Entities" including the Jersey City Department of Public Works (JCDPW), Jersey City Incinerator Authority (JCIA), and JCMUA. JCDPW and JCIA vacated the SA-6 North in 2014 during the implementation of the Chromium Remedy and some of the associated structures formerly occupied by the JCIA were demolished. JCMUA continues operations on Block 6 including primary waste water treatment (grit removal) and sanitary conveyance to the regional Passaic Valley Sewerage Commission (PVSC) wastewater treatment facility located in Kearny, New Jersey. JCMUA also performs vehicle maintenance and material storage and maintains administrative operations on Block 6. Bayfront took ownership of the SA-6 North properties June 5, 2008.
- SA-6 South is also referred to as the "Kellogg Street Properties." SA-6 South was the location of historic industrial and commercial operations. Recent operations included a bowling alley, freight trucking terminals, chemical production, concrete mixing and distribution, boat repair, and light retail and

office space. Honeywell purchased the SA-6 South properties between 2005 and 2010.

Historical maps and aerial photographs indicate that, prior to development, SA-6 South and the surrounding area consisted of marshland, which extended to the edge of the former Morris Canal (approximately the eastern edge of Route 440). Filling activities occurred from approximately the 1920s to the 1950s. The aerial photographs indicate that the area comprising SA-6 and SA-7 had been filled over the years to build up the grade to approximately current levels. No detailed information is available on the placement of chromite ore processing residue (COPR) for the properties comprising SA-6 South. However, it is believed that COPR deposited on SA-7 likely spilled over and was co-mingled with other types of fill, spreading the COPR material onto the adjacent portions of the SA-6 North and South properties. The deposition of COPR is believed to have resulted from operations at a former sodium dichromate plant that operated on the east side of Route 440.

Visual observations of soil borings and sample analytical results from soil borings conducted on SA-6 North and SA-6 South indicate the presence of other types of fill consistent with the NJDEP's definition of "historic" fill in the TRSR. The historic fill map of the Jersey City quadrangle (NJDEP, 2004) was obtained from the NJDEP's website and was reviewed. This map confirms that SA-6 North, SA-6 South, and SA-7 were identified as containing historic fill as mapped by the NJDEP. The resulting material on the SA-6 properties is thus a mixture of COPR and indigenous historic fills and soils.

## 1.3 PROJECT BACKGROUND AND LAND DEVELOPMENT

A redevelopment plan, known as the Bayfront Redevelopment Plan, encompasses the entire 100-acre parcel designated as SA-6 North, SA-7 and SA-6 South (see **Illustrations 1 and 2**) and was approved by the City of Jersey City on March 12, 2008. Remediation of chromium-impacted soils and groundwater was conducted consistent with the planned future use and redevelopment of SA-6 South as set forth in the Bayfront Redevelopment Plan. Remediation of chromium-impacted soils at SA-7 was completed in September 2009. Honeywell remediated SA-6 South from March 2013 to November 2016 so that the Redevelopment Project may now proceed.

Remediation of SA-6 North has also now been completed, and will be reported under a separate RAR and CCR.

**Illustration 1: SA-6, SA-7, and Surrounding Area**

The Bayfront Redevelopment Plan lays out the redevelopment of the nominal 100-acre site that is owned by Bayfront Redevelopment LLC (Bayfront, a subsidiary of Honeywell) and is being developed in partnership with the City of Jersey City into a residential, commercial and retail complex. The Bayfront Redevelopment Plan represents a major opportunity to revitalize the west side of Jersey City; it meets the objectives of Jersey City's master plan for the broader west side area designated as the Bayside Redevelopment Area (see **Illustration 2**).

The Chromium Remedy and Non-Chromium Remedies at both SA-6 North and SA-6 South integrate the requirements of the future Bayfront Redevelopment Plan.

To be consistent with future planned use and the Bayfront Redevelopment Plan, SA-6 South and SA-6 North are divided into Open Space and Development Areas. The designation of these areas is contained in the SA-6 North and SA-6 South Consent Decrees, and is designated as follows:

**Illustration 2: Bayside Redevelopment Area**

- SA-6 North Consent Decree: "Open Space Area" and "Residential Area" and "Additional Excavation Areas." The Residential Area and Additional Excavation Areas are development areas.
- SA-6 South Consent Decree: "Open Space AOC" and "Development AOC." The "Development AOC" consists of two parts: the Kellogg Street Development AOC and the Site 163 Development AOC. When both the Kellogg Street Development AOC and the Site 163 Development AOC are referred to together in this CCR, the term Development AOCs will be used for brevity.

The Bayfront Redevelopment Plan designates the SA-6 North and SA-6 South Development Areas for future residential and commercial/retail use redevelopment, and designates the Open Space Areas for future redevelopment as linear parks and recreational use areas currently known as "Central Park" on SA-6 North and the "Promenade" on SA-6 South. The final grades of the cap associated with the Chromium Remedy in the Open Space AOC are consistent with the Bayfront

Redevelopment Plan grades, with smoothing as needed to facilitate drainage pending development, and associated installation of roadways and stormwater management. Development in the Open Space Area and Site 163 Development AOC Deed Notice Area is also restricted via conservation restrictions that are or will be recorded. **Illustration 3** depicts the conceptual Chromium Remedy related to future redevelopment AOCs.

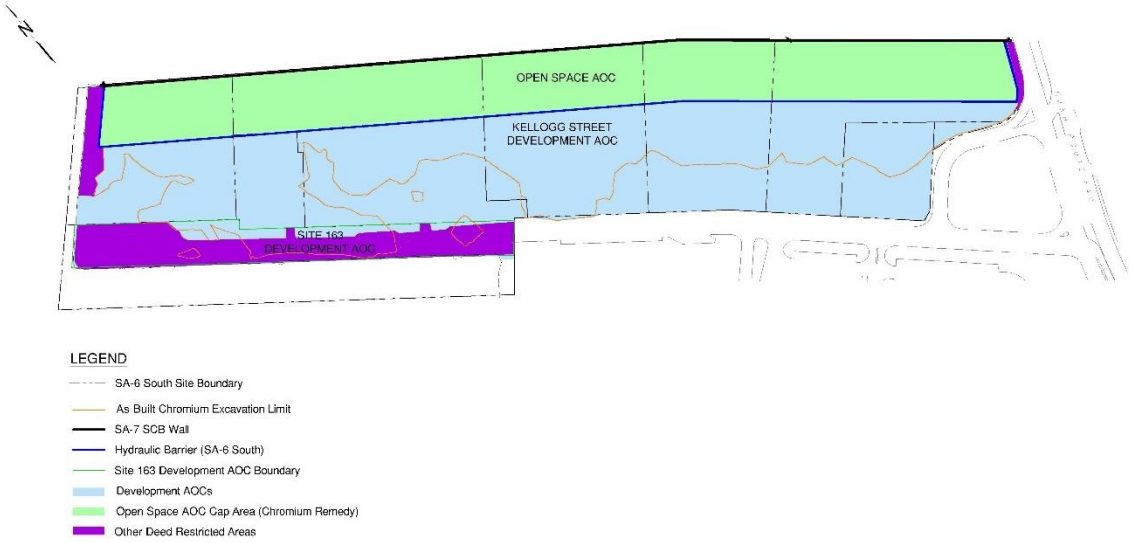

**Illustration 3: SA-6 South Chromium Remedy and Redevelopment Plans**

## 1.4 CONTAMINANTS OF CONCERN AND REMEDIAL ACTION OBJECTIVES

For the purpose of this CCR, the contaminant of concern (COC) in soils at SA-6 South is hexavalent chromium and the COC for shallow groundwater is total chromium per the NJDEP-approved RAWPs. The NJDEP-approved RAWPs identified specific remedial action objectives for soil and groundwater as follows:

Specific Remedial Action Objectives (RAOs) for soils include:

- Prevent exposure to chromium-impacted soils containing hexavalent chromium above the NJDEP soil criteria of 20 milligrams per kilogram (mg/kg) to a depth of 20 feet, consistent with NJDEP policy.
- Remove and consolidate chromium-impacted soils that may be disturbed by future Site redevelopment activities; and reuse soils beneath area to be capped, to the extent feasible.

- Coordinate remedial actions for chromium with remedial actions for non-chromium contaminants and Site redevelopment, to the extent feasible.

Specific RAOs for groundwater include:

- Mitigate the potential for surface water infiltration and leaching of contaminants (total and hexavalent chromium) from fill soils (vadose zone) to groundwater.
- Mitigate offsite migration of chromium in groundwater above the NJDEP Groundwater Quality Standard (GWQS).[7]
- Reduce chromium concentrations in groundwater.
- Prevent exposure to groundwater chromium concentrations above the NJDEP GWQS.

To achieve the RAOs for soils in the Kellogg Street Development AOC, Honeywell excavated chromium-impacted soils to a depth of 20 feet bgs and either disposed of such material offsite or consolidated the material in the Open Space AOC.

To achieve the RAOs for soils on the Open Space AOC, engineering controls (vertical hydraulic barrier and Resource Conservation and Recovery Act [RCRA] cap) were constructed around the Open Space AOC to fully contain existing and consolidated hexavalent chromium-impacted soil. Institutional controls (deed notice and conservation restriction) will also be established for the Open Space AOC so that this area remains as open space.

The NJDEP-approved Site 163 Chromium SRIR/RASR/RAWP indicated that to achieve the RAOs for soils the shallow chromium-impacted soils would be excavated and deeper chromium-impacted soils (i.e., 4 feet or more bgs) would be treated in-situ. However, because in-situ treatment was ineffective, a combination of excavation and capping was instituted. Additional details pertaining to the

[7] The SA 6 South Consent Decree requires Honeywell to isolate shallow groundwater and to intercept and treat shallow groundwater flowing above the meadow mat in the Open Space AOC to the extent that such groundwater contains total chromium in concentrations in excess of 70 µg/l. The Study Area 6 South Consent Decree also requires Honeywell to maintain an outward gradient of shallow groundwater from Study Area 7.

implementation of the in-situ chemical reduction in the Site 163 Development AOC are provided in Section 12. To achieve the soil RAOs for the Site 163 Development AOC Non-Deed Notice Area, chromium-impacted soils were excavated to a depth of 20 feet bgs and either disposed of offsite or consolidated in the Open Space AOC. To achieve the soil RAOs for Site 163 Development AOC Deed Notice Area, shallow chromium-impacted soils (i.e., less than 4 feet bgs) were excavated and either disposed of offsite or consolidated in the Open Space AOC, deeper chromium-impacted soils (i.e., 4 feet or more bgs) were capped, and institutional controls (deed notice and conservation restriction) will be established subsequently.

The RAOs for soils were met in all three AOCs with the exception of the two Deferred Areas discussed in Section 4 and shown on **Figure 19**, and the implementation of the institutional controls in the Open Space AOC and Site 163 Development AOC Deed Notice Area.

It is expected that groundwater RAOs in the Development AOCs will be met because excavation and removal of chromium-impacted soils in the Development AOCs significantly reduced total chromium concentrations in groundwater following completion of the Chromium Remedy. Post-soil remedy total chromium groundwater concentrations in the Development AOCs are now below the NJDEP GWQS for groundwater of 70 micrograms per liter (µg/L) for total chromium throughout most of the Development AOCs (see Section 5.5.1 for further discussion). In the Open Space AOC groundwater RAOs were met by construction of a vertical barrier and a cap which now fully contains groundwater in the Open Space AOC. Further, a contingent groundwater extraction system has been installed to assist in maintaining an inward hydraulic gradient relative to the Open Space AOC. Groundwater monitoring will be implemented in accordance with the Long Term Monitoring Plan (LTMP), currently under development for both SA-6 North and SA-6 South, to establish the post-Remedy disposition of groundwater in the Development AOCs. Groundwater level measurements will be implemented in accordance with the LTMP to monitor hydraulic conditions within the Open Space AOC.

Honeywell will establish appropriate institutional controls at SA-6 South including deed notices and a remedial action permit for soils for four distinct areas: the Open Space AOC, the Site 163 Development AOC Deed Notice Area, and the two Deferred Areas. A remedial action permit for groundwater in the Open Space AOC will be

requested from NJDEP. A Classification Exception Area (CEA) has already been established with NJDEP for the regional shallow groundwater. Honeywell may revise the boundary of the shallow groundwater CEA slightly based upon the post-remediation results of shallow groundwater sampling at SA-6 South. More details concerning the institutional controls are provided in Section 18.

Sections 4 and 18.1 more fully describe the deed noticed areas, but a summary of the four areas at SA-6 South are:

- Deed Notice Area 1: Open Space AOC
- Deed Notice Area 2: Route 440 Right of Way (ROW)
- Deed Notice Area 3: Portion of Site 163
- Deed Notice Area 4: Site 073 Bulkhead Area and the SA-7 Bulkhead Area.

## 1.5 CONSTRUCTION OVERVIEW

The Chromium Remedy for the Kellogg Street Development AOC and the Site 163 Development AOC Non-Deed Notice Area consisted of excavation of soils exceeding 20 mg/kg hexavalent chromium to the elevations established in the SA-6 South 100% Design Report, DC 2013-12-12, DC 2014-5-06, and DC 2015-9-28 based either upon pre-design investigation (PDI) sample data or encountering Stratum D. Depending on the hexavalent chromium concentration, the excavated soil from the Development AOCs was either disposed of offsite, consolidated under the cap in the SA-6 South Open Space AOC (20-1,000 mg/kg) or transferred to the SA-6 North Open Space AOC (20-240 mg/kg). To contain impacted groundwater within the Open Space AOC, hydraulic barriers keyed into the Stratum D were installed on the east, south and west sides of the open space AOC. The SA-7 Soil-Cement Bentonite (SCB) Wall forms the northern side of the hydraulic barrier. The southern hydraulic barrier also serves as temporary excavation support for the adjacent excavation in the Development AOC. A RCRA-equivalent cap was constructed over the Open Space AOC to isolate chromium-impacted soils. A clean soil and gravel cap was constructed in the Site 163 Development AOC Deed Notice Area to isolate chromium-impacted soils at a depth of 4 feet or more bgs.

More specifically, the Chromium Remedy included the following main work elements:

- Site preparation (utility mark out, temporary fencing, and erosion controls);
- Remedial Contractor mobilization and installation of site support facilities including construction trailers, decontamination stations, utility abandonment and bypassing, soil erosion controls, construction dewatering and stormwater control and treatment infrastructure;
- Abandonment/demolition/removal/relocation of existing structures, select monitoring wells, and utilities as necessary to remediate chromium-impacted areas;
- Construction water management;
- Installation of temporary sheetpile for excavation support;
- Excavation within the designated Kellogg Street Development AOC and Site 163 Development AOC Non-Deed Notice Area of chromium-impacted soils exceeding 20 mg/kg hexavalent chromium to a maximum depth of 20 feet or shallower if meadow mat (Stratum D) was reached;
- Consolidation of excavated material exhibiting hexavalent chromium concentrations between 20 and 1,000 mg/kg within the Open Space AOC;
- Offsite disposal and transportation of excavated material exhibiting hexavalent chromium concentrations exceeding 1,000 mg/kg;
- Installation of a hydraulic barrier along the perimeter of the designated Open Space AOC that was embedded approximately 2 feet (minimum) into the underlying Stratum D and was tied into the existing hydraulic barrier associated with the SA-7 remedy along the common SA-6 South and SA-7 boundaries;
- Installation within the Open Space AOC of a contingent groundwater extraction system which will be operated as needed to maintain an inward hydraulic gradient as specified in the SA-6 LTMP that is currently being developed;
- Soil surcharging in the Open Space AOC to consolidate underlying compressible strata;
- Grading of consolidated soil from other areas in the Open Space AOC and compaction of existing material/subgrade fill;

- Installation of the RCRA-equivalent geosynthetic cap system, including a methane venting layer to address naturally occurring methane;
- Installation of surface drainage and erosion control structures;
- Installation of a cap drainage system to collect stormwater infiltration and discharge to surface water;
- Installation of utility corridors for future site redevelopment;
- Installation of piezometers and/or monitoring wells within the Development AOC, the Open Space AOC, and SA-7, to allow for groundwater level monitoring for hydraulic control and groundwater sampling;
- Restoration of site and vegetation planting; and
- Recording of institutional controls and initiation of future monitoring.

**Table 10** provides a cross-reference table of major construction elements referenced to particular components of the SA-6 South 100% Design (100% Design Report, Specifications, and Drawings), DCs, and the Declarations documenting completion of specified portions of the Chromium Remedy.

The Chromium Remedy activities included the following major categories, and corresponding approximate quantities for SA-6 South (quantities that are combined for SA-6 North and SA-6 South are noted):

| Item | Units | Quantity |
|---|---|---|
| Construction Water Discharged (North and South) | Gallons | 41,257,040 |
| Abandoned Existing Monitoring Wells/Piezometers | Each (EA) | 47 |
| Dewatering Wells | | |
| Shallow | EA | 339 |
| Deep | EA | 6 |
| New Monitoring Wells | | |
| Piezometers | EA | 10 |
| Monitoring Wells | EA | 11 |
| Material Handling | | |
| Recycled Concrete | Cubic Yards (CY) | 18,000 |
| Excavated Soils | | |

| Item | Units | Quantity |
|---|---|---|
| <20 mg/kg | CY | 73,700 |
| 20-240 | CY | 50,800 |
| 240-1,000 | CY | 18,700 |
| >1,000 | CY | 25,000 |
| New Stormwater Pipe | Linear Feet (LF) | 463 |
| Consolidated Materials | | |
| 20-1,000 (South) | CY | 35,000 |
| 20-240 (North) | CY | 35,000 |
| Petroleum | CY | 24,000 |
| Asphalt | CY | 1,250 |
| Hydraulic Barrier | LF | 2,586 |
| Cap Materials | | |
| Subgrade Fill | CY | 59,000 |
| Geosynthetic Venting Layer (GVL) | Square Feet (SF) | 245,217 |
| Geosynthetic Composite Layer (GCL) | SF | 46,797 |
| Geotextile Layer | SF | 62,779 |
| Geosynthetic Drainage Layer (GDL) | SF | 352,500 |
| Liner | SF | 352,500 |
| GDL Soil | CY | 15,200 |
| Root Barrier | SF | 352,500 |
| Clean Cover Soils | CY | 43,000 |
| Backfill | | |
| <20 mg/kg | CY | 33,500 |
| Imported Fill: Dense Grade Aggregate (DGA)/Screenings | CY | 130,000 |
| Clean Stone leftover from SA-7 Sediment Remedy | CY | 1,000 |
| Celgene, Somerset, NJ Excavation | CY | 69,000 |
| Clean Stone leftover from NJCU | CY | 17,000 |
| Surcharge | | |
| Soil | CY | 240,000 |

| Item | Units | Quantity |
|---|---|---|
| Monitoring Points | EA | 22 Half Stations<br>7 Full Stations<br>8 Settlement Platforms |
| Disposal | | |
| Recycled Asphalt | Tons | 3,700 |
| >1,000 | Tons | 33,000 |
| Concrete | Tons | 815 |
| Petroleum | Tons | 36,000 |
| Debris | Tons | 315 |

The following entities were involved in the construction of the SA-6 South remediation (see also **Figure 3,** Project Team Organization Chart):

| Party | Responsibility |
|---|---|
| **Honeywell** | Overall compliance with court-ordered remediation |
| **Amec Foster Wheeler** | Engineer of Record (EOR), Design, Contract Documents, Construction Inspection, Health and Safety Oversight, and Overall Site Construction Management |
| **Entact** | Excavation of COPR, imported backfill purchase and placement, and Dewatering and Groundwater Extraction |
| **Entact Subcontractors:**<br>**B&B Drilling, Inc.**<br><br>**Maser Consulting P.A.**<br>**Chemtech**<br><br>**Eurofins**<br><br>**Vertical V-Northeast**<br>**ESI** | <br>Install and abandon monitoring wells and piezometers<br>Surveying<br>Analytical Laboratory for Imported Fill Samples (non-chromium)<br><br>Analytical Laboratory for Imported Fill Samples (chromium)<br><br>Compaction Testing<br>Installation of all geosynthetic materials for the RCRA-equivalent cap |
| **Emilcott Associates** | Air Monitoring |
| **Arecon** | Manifests, and Management of Excavated Soil Disposal |
| **Mueser Rutledge Consulting Engineers (MRCE)** | 3rd Party Structural and Geotechnical Engineering Peer Review |
| **Langan** | 3rd Party Liner QA |

| Party | Responsibility |
|---|---|
| **Accutest Laboratories Inc. (Accutest)** | Analytical Laboratory for samples collected by Amec Foster Wheeler |
| **Travelers Industrial Hygiene Laboratory** | Analytical Laboratory for Perimeter Air Monitoring Plan (PAMP) samples |
| **Analytical & Environmental Services, Inc. (AESI)** | 3rd Party Analytical QA/QC |
| **Validata, LLC** | 3rd Party Analytical Data Validation |
| **Cornerstone** | Groundwater Modeling |
| **Geocomp Engineering** | Prepared Vibration Monitoring Report |

Mobilization commenced on March 1, 2013 and was completed on June 28, 2013. The Chromium Remedy on SA-6 South was substantially complete by November 2016. Work on SA-6 North was also substantially completed by November 2016. Representative photographs of major components of the work are included in **Appendix A.**

## 1.6 DATA VALIDATION AND DATA USABILITY EVALUATION

Unless otherwise indicated for specific sample types, Accutest analyzed soil and groundwater samples collected during the Chromium Remedy implementation. Hexavalent chromium analysis was performed using United States Environmental Protection Agency (USEPA) Method 7199. Data validation was performed by a third-party data validation specialist with Validata, LLC (Validata) of Seattle, Washington. Additionally, Honeywell employs Dr. Rene Surgi of Analytical & Environmental Services, Inc. (AESI) of Glencoe, Illinois, to provide third-party analytical quality assurance/quality control (QA/QC).

Honeywell's protocol was to have Dr. R. Surgi review 100% of the soil sample hexavalent chromium analytical data and work with Accutest on any QA/QC matters prior to issuance of the final analytical data packages. Soil samples that do not meet the laboratory's strict internal QA/QC criteria are re-logged by the laboratory and re-analyzed. Once the data packages are issued by Accutest to Validata, the hexavalent (and total chromium, if performed) chromium data are validated. Employing such a protocol provides a high degree of confidence that the hexavalent chromium analytical data that has passed the internal laboratory QA/QC standards and was not rejected by the validator is accurate, precise,

representative and, thus, usable. Rejected data, although reported, is flagged with an "R" and is not used for the intended purpose of the associated sampling.

The Data Management Plan (DMP) contained in the SA-6 North 100% Design Report outlined, among other things, the specific data validation objectives and procedures involved in producing quality, usable analytical data during implementation of the Chromium Remedy. Honeywell revised the DMP in August 2014 to clarify data validation level and frequency based upon the purpose of the sampling and end use of the data. This revised DMP was submitted to NJDEP and all Parties on August 22, 2014. A summary of the data validation level and frequency for soil samples analyzed for total and hexavalent chromium collected during the SA-6 Chromium Remedy and based upon the revised DMP was as follows:

- Level IV data validation on 100% of samples analyzed that were used for compliance purposes (i.e. post-excavation soil samples and those collected for re-use applicability of excavated material and quarterly groundwater samples); and
- Level II data validation of approximately 25% on samples that were used for non-compliance purposes (i.e. samples for soils consolidated in the Open Space AOC and those collected from soils being disposed of offsite).

Additionally, and in accordance with the DMP, data validation was also conducted on the following samples that included analysis of parameters other than total and hexavalent chromium:

- Level IV data validation on 100% of the monthly effluent water samples for tested parameters;
- Level IV data validation on 10% of soil samples for other (non-chromium) tested parameters; and
- Level IV data validation of approximately 10% of the PAMP air samples analyzed for hexavalent chromium for other (non-chromium) tested parameters. Those samples for which data validation was conducted only on a 10% frequency are indicated as **Tables 1A and 1B**.

The NJDEP issued guidance for the Data of Known Quality Protocols (DKQPs) in April 2014, approximately 1 year after the start of the SA-6 Chromium Remedy. The NJDEP was consulted regarding whether the questionnaire that is part of the DKQP process needed to be filled out for samples collected during the implementation of the Chromium Remedy. NJDEP concluded that the DKQP questionnaires were not required for the Chromium Remedy since the laboratory follows rigorous QA/QC protocols specifically developed for the chromium program in Jersey City which results in the generation of data of known quality and because the third-party validation process covers the data assessment and usability evaluation promoted in the DKQP guidance. We note that the validation process essentially asks the same questions as those on the questionnaire. As indicated above, 100% of such samples for hexavalent chromium analysis were validated by Validata, whereas validation of all other analytical parameters was conducted on 10% of the samples. Rejected data is not used.

Given the high level of internal and external QA/QC that is conducted, the 100% data validation that Honeywell employs for hexavalent chromium, and validation of 10% of samples for analytical parameters other than hexavalent chromium, the analytical data meets NJDEP's standards of precision, accuracy, and usability.

Copies of the laboratory analytical reports and the data validation reports are available upon request. Electronic Data Deliverable (EDD) documentation is included in **Appendix B**.

## 1.7 REPORT ORGANIZATION

This document has been prepared to meet the provisions specified in Sections 1.6 and 5.7 of the TRSR and contains the following sections:

- *Introduction.* This section contains information on the purpose and scope of the document, pertinent site setting information, project background and relationship between the Bayside Redevelopment Area and Bayfront, COCs and RAOs, overview of the Chromium Remedy construction elements, and report organization.
- *Preparatory Construction Activities.* This section describes the activities implemented that were in support of the main elements of the Chromium Remedy.

- *Modifications and field changes to* SA-6 South *100% Design Report.* Changes to what was proposed in the SA-6 South 100% Design report are summarized in this section.
- *Deferred Areas and Unanticipated Items Encountered During Remedial Activities.* These sections summarize uncompleted, unexpected or unanticipated conditions encountered during implementation of the Chromium Remedy.
- *Dewatering and Construction Water Treatment* (Section 6) through *Site Restoration* (Section 14). Detailed descriptions of the main elements of the Chromium Remedy are provided in these sections. Tables and figures are used to graphically communicate the information.
- *Construction Permits.* This section presents a description of the permits obtained to implement the Chromium Remedy.
- *Sustainability Efforts During Construction.* Sustainable elements of the Chromium Remedy implementation are presented in this section.
- *Post-Remedy Operation & Maintenance.* This section describes the activities to inspect, monitor, and maintain elements of the Chromium Remedy that remain. In addition, groundwater monitoring and sampling is described.
- *Institutional Controls*. The implementation of deed notices, soil and groundwater remedial action permit(s), and a classification exception area are presented in this section.
- *Record Drawings*. Record drawings are discussed and provided.
- *Remedial Action Costs*. A summary of the costs to complete the project are provided.
- *Remediation Close Out Summary*. This section contains the conclusions and recommendations.
- *References.* References used in preparing this document are listed in this section.
- *List of Acronyms and Abbreviations.* This section contains a list of acronyms and abbreviations used in this document.

# 2.0 PREPARATORY CONSTRUCTION ACTIVITIES

On behalf of Honeywell, Amec Foster Wheeler managed and oversaw the bidding and contractor selection process for the SA-6 South Chromium Remedy. The selected contractor was Entact LLC (Entact) of Pittsburgh, Pennsylvania. Prior to mobilization, Entact prepared and submitted to Amec Foster Wheeler and Honeywell various work plans and submittals and acquired certain construction permits and approvals required by the SA-6 South 100% Design Report for implementation of the SA-6 South Chromium Remedy.

In addition, several other permits were obtained by Amec Foster Wheeler for execution of the SA-6 South Chromium Remedy during the design process. Other additional permits were obtained after the design process as detailed designs prepared by Entact were needed to obtain certain permits. Permits acquired for implementation of the SA-6 South Chromium Remedy are listed in Section 15.

## 2.1 MOBILIZATION AND SITE PREPARATION

Amec Foster Wheeler and Entact mobilized equipment and labor forces to SA-6 South between March 1, 2013 and June 28, 2013. Mobilization and site preparation included the following key activities:

- Re-establishment of Amec Foster Wheeler and Honeywell office space in the southern portion of the building located at 60 Kellogg Street;
- Mobilization and set-up of office trailers at SA-6 South for Entact operations. The trailers were outfitted with temporary electrical, internet, and telephone infrastructure;
- Establishment of a global positioning system (GPS) base station for use with construction layout and surveying;
- Mark-out of excavation, capping, staging and lay down areas;
- Geophysical surveys to locate unknown utilities, utility mark-outs, onsite utilities to be maintained, relocated or abandoned;
- Establishment of vehicular traffic pathways and staging areas;
- Installation of soil and erosion controls;

- Setup of the temporary construction water treatment plant (CWTP) at SA-6 North. The CWTP was utilized for SA-6 North and SA-6 South;
- Relocation of electrical feed for SA-7 regional groundwater extraction wells;
- Construction of decontamination facilities; and
- Installation of fencing, and establishment of initial exclusion zones, contaminant reduction zones and support zones. Such zones were maintained and modified as needed throughout the execution of remediation activities.

Other preparatory activities that occurred either just prior to or during initial stages of the construction activities are described in the sections that follow.

## 2.2 HEALTH AND SAFETY

Health and Safety on the SA-6 South Chromium Remedy was controlled by a Master Health and Safety Plan (HASP). The Master HASP was included as Appendix D of the SA-6 North Chromium Remedy 100% Design Report and was used for SA-6 South. Each site contractor was required to prepare and submit a HASP for their specific work requirements in conformance with the Master HASP. Direct responsibility for employee safety was retained by each contractor as outlined in the contractor's respective HASP.

The minimum personal protective equipment (PPE) for personnel within the fenced-in portion of SA-6 South included hardhats, high visibility vests, gloves, safety glasses, and steel toed boots. Minimum worker PPE within exclusion zones at SA-6 South consisted of hardhat, safety glasses, high visibility vests, Tyvek™ suits, gloves, and steel-toed boots. Upon leaving the exclusion zone, disposable PPE was placed into containers staged within the contamination reduction zone. Non-disposable PPE was decontaminated in the same area. Disposable PPE was combined with other chromium-impacted waste and transported and disposed of offsite. Decontamination fluids were processed through the onsite CWTP and subsequently discharged via JCMUA and PVSC discharge permits and agreements.

During the course of the project, 386,624 man-hours were worked on site. This number represents the combined total with SA-6 North as this was conducted as an integrated project. Of that total, approximately 60% of the total hours worked could

be allocated to SA-6 South. There were no Occupational Safety and Health Administration (OSHA) recordable incidents for the SA-6 South Chromium Remedy. Annual details are summarized in the table below:

| Year | Man-Hours* |
|---|---|
| 2013 | 60,928 |
| 2014 | 132,272 |
| 2015 | 104,384 |
| 2016 | 89,040 |
| **Project Total** | **386,624** |

*The man-hours include all hours on both SA-6 North and SA-6 South from mobilization through November 18, 2016.

A perimeter air monitoring program was carried out to document protection of human health outside of the remediation zone(s) to airborne COCs. The perimeter air monitoring program is discussed in detail in Section 11, but background and baseline monitoring activities are presented briefly below in Section 2.3 as they were part of the preparatory construction activities. In the course of the project, there were no exceedances of the perimeter air action levels.

## 2.3 BACKGROUND AND BASELINE PERIMETER AIR MONITORING

A perimeter air monitoring program (PAMP) was implemented and maintained whenever ground intrusive activities were occurring throughout the course of the SA-6 Chromium Remedy. The PAMPs were provided in the 100% Design Report. Separate PAMPs were prepared for SA-6 North and SA-6 South to account for the disparate durations of ground intrusive activities between SA-6 North and SA-6 South. The PAMP for SA-6 South was Appendix F of the SA-6 South Chromium Remedy 100% Design Report. More details of the overall perimeter air monitoring program are provided in Section 11.

During the mobilization phase and prior to ground intrusive activities, background perimeter air monitoring was performed to establish baseline air conditions that could be used for comparison to those measured during ground intrusive activities as shown on **Table 1A**. The background sampling was conducted for a minimum of 10

days during fair weather conditions (i.e., not during rain, snow, or high humidity) from July 15, 2013 to August 6, 2013.

Upon completion of the baseline sampling activities, the laboratory analytical data, real-time volatile organic compounds (VOC) [if applicable] and particulate matter dust monitoring data, and meteorological data was tabulated and presented to Honeywell. **Table 1A** summarizes the baseline perimeter air monitoring sample analytical data collected. **Figure 4** indicates the locations of the PAMP stations.

## 2.4 SITE SECURITY

Site security was established during the mobilization phase. Site security focused on perimeter security and access. The primary feature of Site Perimeter security was the perimeter fence line. SA-6 North was already surrounded by a perimeter fence due to the presence of the Jersey City Entities at that Site. The existing chain link fence along the exterior borders of SA-7 and SA-6 South previously installed during the remediation of SA-7 was repaired and replaced, as needed. Where new fence was required, 8-foot chain link fence was installed (equivalent to that installed on SA-7).

In addition to the perimeter fencing, control of access to SA-6 North, SA-6 South, and SA-7 was established primarily by use of strategically placed gates in the perimeter fencing. Site Access for SA-6 South was established with the entrance and exit through a security manned gate from Kellogg Street. No access to SA-7 was provided from offsite locations. All access to SA-7 was from either SA-6 North or SA-6 South.

Finally, a 24-hour security guard presence was also maintained throughout the project. Guards patrolled SA-6 North, SA-6 South, and SA-7 in vehicles.

## 2.5 SUPPORT FACILITIES AND TEMPORARY SITE UTILITIES

Support facilities for the Honeywell and Amec Foster Wheeler construction management and Entact teams were also established during mobilization. Honeywell and Amec Foster Wheeler shared office space in the southern portion of the existing building at Site 125 (60 Kellogg Street) from the beginning of mobilization in March 2013 until February 2016. Once Honeywell and Amec Foster

Wheeler moved out of the office space at Site 125, a set of permanent office trailers was established in the northeast corner of SA-6 North.

Water for construction and dust suppression activities for both SA-6 North and SA-6 South was obtained from a JCMUA fire hydrant located on SA-6 North.

Additionally, the CWTP was constructed between the former JCMUA Sludge Digesters and the JCDPW "H" building. The construction of the CWTP is described in more detail in Section 6.3. SA-7 was used for the staging of incoming clean materials including surcharge fill and geosynthetic materials. Equipment staging, parking, truck staging, and other storage was located in available areas.

## 2.6 TRAFFIC CONTROL

Onsite traffic associated with remedial activities was controlled by using designated routes established in the 100% Design and DC 2016-05-06. A paved, perimeter road was established on SA-7, which provided access to both SA-6 South and SA-6 North. Temporary ramps were built out of clean fill for transport between elevation changes on both SA-6 South and SA-6 North. These routes were marked using orange construction fence, traffic barricades, jersey barriers, signage and/or other types of traffic control devices.

Offsite truck traffic routes were consistent with routes previously approved for SA-7 and SA-5 remediation projects. The offsite truck routes used are indicated on **Figure 5**.

## 2.7 DEMOLITION

In accordance with a Site Preparation Plan prepared for SA-6 South, dated November 1, 2011, buildings were demolished on SA-6 South as part of the SA-6 Chromium Remedy as listed below.

| NJDEP Site No. | NJDEP Site Name | Feature(s) |
|---|---|---|
| 125 | Delphic Consolidated | 1 Building |
| 134 | Boatyard | 1 Building |
| 140 | ABF Trucking | 4 Buildings |
| 163 | Posnak & Turkish | 2 Buildings |

Prior to demolition, each impacted facility was evaluated for inventory, hazardous material survey/characterization, removal/abatement, decommissioning, and demolition. Viable products remaining at the facilities were shipped to other facilities that could either use, store, or manage the product. Decommissioning included the cleaning of equipment, piping, and storage vessels; the management, removal, and recycling of the tank bottom sludge, if any; abatement of environmentally sensitive building materials (such as asbestos containing building materials); and removal of Universal Wastes such as mercury devices, refrigerant, lamps, light ballasts, and batteries. Buildings and above-ground storage tanks were demolished and equipment, piping, and materials removed from SA-6 South. Demolition permits were received prior to ground intrusive work.

## 2.8 UTILITY ABANDONMENT

Utilities at SA-6 South included gas, electric, telephone/internet, water, storm and sanitary sewer which serviced SA-6 South. Utilities that crossed into the excavation areas were removed. Additionally, a section of storm sewer adjacent to Site 140 along Kellogg Street was replaced and a new catch basin was installed as shown on the Record Drawing, entitled "As Built Restoration Plan."

## 2.9 GROUNDWATER TESTING FOR pH

During the mobilization phase and early stages of the Chromium Remedy implementation and prior to ground intrusive activities, Amec Foster Wheeler collected groundwater pH readings from 13 different locations along the proposed hydraulic barrier wall alignments at SA-6 South. The groundwater pH measurements were necessary to determine the type of sealant material that was suitable for the hydraulic barrier (sheetpile) joints.

Groundwater pH values above 11.5 standard units required a cement-bentonite grouted seal. **Figure 6** shows the measured pH values at each SA-6 North and SA-6 South location and stationing along the hydraulic barrier wall alignments. Section 10 details the installation of the hydraulic barrier and sealing of its joints.

The pH monitoring was performed in accordance with the methodology documented in a technical memorandum, dated August 12, 2013 and submitted by Honeywell to All Parties. All pH monitoring was performed in the fill above the meadow mat

(Stratum D). Groundwater measurements were collected by Amec Foster Wheeler personnel certified with the NJDEP Office of Quality Assurance to perform field analysis of non-potable water for specific conductance, turbidity, dissolved oxygen, pH and temperature.

## 2.10 WASTE CLASSIFICATION

The *Proposed In Situ Waste Classification and Disposal Facility Approval Sampling Plan* (Amec, 2013) established a protocol for the sampling and analysis of the estimated 25,120 CYs of potentially chromium-impacted material that was planned to be disposed offsite from both SA-6 North and SA-6 South. Materials containing hexavalent chromium >240 mg/kg at SA-6 North or >1,000 mg/kg at SA-6 South were designated for offsite disposal as shown on **Figures 7A through 7G**.

In order to properly classify the material for offsite disposal, the NJDEP *Waste Classification Request Form and Instructions* dated June 22, 2009 were used as a reference for the specific sampling frequency and analysis for the waste classification protocol in addition to any receiving disposal facilities' acceptance criteria.

In addition to the hexavalent chromium impacted soil, SA-6 South contained non-chromium impacted soil with other COCs. In some locations, the soil exhibiting the non-chromium COCs was co-mingled with the potentially chromium impacted material, although typically not with the higher hexavalent chromium concentrations that required offsite disposal. Therefore, waste characterization samples were also collected from those AOCs at SA-6 South that contained the non-chromium COCs, using the same two-part compositing procedure for chromium-impacted areas designated for offsite disposal. The results were compared to RCRA hazardous limits. This sampling protocol was used by Honeywell to properly classify the material and obtain disposal facility approvals as needed.

# 3.0 MODIFICATIONS AND FIELD CHANGES TO SA-6 SOUTH 100% DESIGN REPORT

Throughout the course of the implementation of the SA-6 Chromium Remedy, it was occasionally necessary to make modifications to the SA-6 South 100% Design Report based upon unforeseen field conditions and/or provide further detail to conceptual design items. Design changes were documented in DCs. Design changes are classified as either major or minor, where major DCs were defined as those that could significantly impact cost and schedule and minor DCs as those having minimal to no impact to cost and schedule.

DCs were issued using sequential numbering starting with DC 000. A single combined DC log was maintained for SA-6 South and SA-6 North (see **Appendix D**). Some DCs applied to both sites. For purposes of the Special Master process a separate numbering system was maintained. The DC Log provides a cross reference to the Special Master numbering.

During the course of the project a number of requests for information (RFIs) were received from the contractor. These RFIs sought clarification on specific areas of the SA-6 South 100% Design Report. Responses to all requests were provided. In the cases where a RFI resulted in a design change an associated DC was prepared and issued.

# 4.0 DEFERRED AREAS

As discussed in the Executive Summary, and Sections 1.4 and 4.5.2, there are two areas within the SA-6 South Development AOC where excavation was technically impracticable during implementation of the SA-6 Chromium Remedy. Remediation of these areas will be deferred until a later time.[8] In the meantime, Honeywell will establish deed notices on both areas until remediation can be completed. These two areas are shown on **Figure 19** and are referred to as the Route 440 ROW and Site 073 Bulkhead Deferred Areas, corresponding to Deed Notice Area 2 and Deed Notice Area 4, respectively. Honeywell will document the remediation of each Deferred Area with a supplement to this CCR after the completion of the remedial work in each Deferred Area.

Deed Notice Area 2 is an approximately 1,300 SF strip of land on SA-6 South between the eastern boundary of the SA 6 South Open Space AOC (eastern hydraulic barrier) and the Route 440 ROW. Public Service Electric & Gas (PSE&G) owns and operates a 24-inch high pressure gas main within the ROW in this area. Honeywell inquired of PSE&G and New Jersey Department of Transportation (NJDOT) about the potential relocation of a portion of this gas main and determined that utility relocation should be deferred pending the comprehensive Route 440 Road Widening Project which is currently in the design phase. Consequently, a portion of the eastern SA-6 South hydraulic barrier was relocated approximately 10 feet westward in this area. The Route 440 Road Widening Project is expected to commence no later than 2019, three years from the completion of the Chromium Remedy. Honeywell will continue to monitor NJDOT and PSE&G progress on the Route 440 Road Widening Project and will address residual chromium contamination proximate to the gas line when relocated in the future for the Route 440 improvements.

As indicated in Section 4.1 of the SA-6 South 100% Design Report, the hydraulic barrier alignment was moved approximately 10 feet to the west to avoid impacts to the gas main. Consequently, this approximately 15-foot wide portion of SA-6 South

[8] In the event that the Route 440 road widening project and the bulkhead repair project are not completed by the end of 2021 (five years after completion of the SA-6 Chromium Remedy), the Parties will confer regarding appropriate action for the Deferred Areas.

was then outside of the hydraulic barrier/cap of the Open Space AOC. As indicated in Section 4.1 of the SA-6 South 100% Design Report, Honeywell indicated its intention to defer excavation of chromium-impacted soil within the Deed Notice Area 2 footprint until such time that the gas main is relocated during the Route 440 Road Widening Project. Excavation of residual chromium-impacted soil between the eastern hydraulic barrier and the SA-6 South property line in this area will be coordinated with the relocation of the gas main during the Route 440 Road Widening Project. In the meantime, Honeywell will institute a deed notice on this area. Once the remediation of this area is complete and achieves soil RAOs, Honeywell will terminate the deed notice. A draft of the deed notice is contained in **Appendix R**.

Deed Notice Area 4 is comprised of two tracts of land; Tract 1[9] is on SA-7 and Tract 2 is on a portion of Site 073 on SA-6 South. Tract 2 will be discussed further herein. Tract 2 is an approximately 11,600 SF area adjacent to the bulkhead partially between the western boundary of the SA 6 South Open Space AOC (western hydraulic barrier) and the bulkhead and partially south of the SA-6 South Open Space AOC. The SA-6 South 100% Design plan for the Site 073 deferred area was to excavate the top 4 feet of soils within the deferred area and defer additional excavation below a depth of 4 feet until implementation of the Bayfront Redevelopment Plan when the bulkhead will either be repaired or replaced. Because an approximately 5-foot thick concrete slab was unexpectedly encountered while excavating in this area and because removal of this concrete would jeopardize the integrity of the bulkhead, DC 2014-5-19 proposed deferral of *all* excavation in this area until implementation of the Bayfront Redevelopment Plan. The proposal to defer remediation was approved by all parties and the Special Master under the SA-6 South Consent Decree. Excavation of residual chromium-impacted soil along the bulkhead in Tract 2 will be coordinated with bulkhead improvement work to be implemented during the Bayfront Redevelopment Project. In the meantime, Honeywell will institute a deed notice on this area (both Tracts 1 and 2 together in

[9] Tract 1 on SA-7 is the "Technically Impracticable Area or TI Area" identified in the SA-7 RAR. NJDEP issued a conditional No Further Action letter for SA-7 soils, excluding the TI Area. Soils within Tract 1 met the Final Judgment cleanup objective of 240 mg/kg for hexavalent chromium for SA-7, but did not meet the 20 mg/kg objective in the NJDEP Chromium Policy. Soils exceeding the 20 mg/kg objective for hexavalent chromium are covered by at least 7 feet of clean soils. Tract 1 will not be remediated by Honeywell. Instead, the 7-foot thick clean soil cap will remain in place and Tract 1 will be subject to a Deed Notice.

Deed Notice Area 4). Once the remediation of the Tract 2 area is complete and achieves soil RAOs, Honeywell will terminate the deed notice for Tract 2. Tract 1 will continue to be subject to a deed notice. A draft of the deed notice is contained in **Appendix R**.

It is not anticipated that the Bayfront Redevelopment Project will impact Deed Notice Area 2 because this area is so narrow, is proximate to the Route 440 ROW, and the gas main is located within the area. Development of this area will be deferred until the gas main is relocated. The Bayfront Redevelopment Project bulkhead reconstruction will impact Deed Notice Area 4. However, once appropriate permits are obtained for the bulkhead reconstruction and the embankment in this area is secured, the remediation of chromium-impacted soil in Tract 2 of Deed Notice Area 4 will be implemented in connection with the Bayfront Redevelopment Project.

# 5.0 UNANTICIPATED ITEMS ENCOUNTERED DURING REMEDIAL ACTIVITIES

During excavation activities at SA-6 South, numerous unforeseen subsurface features, conditions, or structures were encountered requiring actions not included as part of the SA-6 South 100% Design including the following:

- A larger than expected quantity of miscellaneous concrete building slabs, and foundations;
- Arsenic-impacted asphalt;
- Debris co-mingled as part of the historic fill;
- Hydrocarbon-impacted soil;
- Three unregistered underground storage tanks (USTs); and
- Discontinuities related to penetrations, vertical cracks, and vertical shear zones of Stratum D.

Additional sampling was conducted that included:

- An initial post-remedial quarterly groundwater sampling event;
- Soil sampling in the Site 073 deferred area; and
- Soil sampling of anomalous material as described in Sections 8.6 and 8.7.

Descriptions of these items, with the exception of anomalous material sampling, are provided in the sections below.

## 5.1 CONCRETE BUILDING SLABS, FOUNDATIONS, ARSENIC-IMPACTED ASPHALT, DEBRIS

A larger than expected volume of concrete building slabs, foundations, and debris from previous structures were encountered. Concrete and arsenic-impacted asphalt was sampled, analyzed, evaluated, and handled in accordance with the NJDEP-approved Soil Management Plan (SMP) which was part of the 100% Design Report and the *Proposed Concrete and Asphalt Sampling Plan* (CASP), dated September 2013 which was submitted to the NJDEP on October 28, 2013. The SMP allowed

concrete meeting NJDEP reuse parameters to be reused onsite as backfill in excavations or placed in the Open Space AOC with consolidated chromium-impacted soil. Most of the concrete that met the reuse criteria was sized to 3-inch minus for reuse by Entact in accordance with the SA-6 South 100% Design Report. Details concerning the sampling, testing, and disposition of the concrete material are contained in Section 9.

As part of the SA-6 Chromium Remedy, Entact collected 16 samples (Asphalt-001 through Asphalt-016) of the existing asphalt pavement throughout the excavation footprint at SA-6 South in accordance with the September 2013 CASP. The sampling procedures followed are detailed in **Appendix J-1**. The locations of the asphalt samples are shown on the figure provided in **Appendix J-1**. The quantity of asphalt represented by the samples was approximately 1,250 CYs or 2,100 tons. The purpose of the sampling was to determine the disposition of the asphalt in accordance with the NJDEP-approved SMP. Upon approval by the NJDEP, all of the arsenic-impacted asphalt was consolidated in both SA-6 North and South Open Space Areas.

A larger volume than expected of debris was encountered comingled with soil in the eastern (Sites 124 and 125) and central (Site 134) portions of the SA-6 South excavation areas. The composition of the debris and soil separation procedures are described in **Appendix J-1**. The debris-free soil was then considered suitable for reuse or consolidation in both SA-6 North and South Open Space Areas. The debris was disposed of offsite, totaling 315 tons.

## 5.2 HYDROCARBON-IMPACTED SOIL AT SA-6 SOUTH

Hydrocarbon-impacted soil was first encountered during the excavation at Site 124 and continued into Site 125 in the eastern part of SA-6 South. Additionally, hydrocarbon-impacted soil was encountered at Site 073 and Site 134 in the western part of SA-6 South. These materials were identified by their odor and elevated photo-ionization detector (PID) readings in the work zone. Entact segregated and stockpiled the hydrocarbon-impacted soil based upon the hexavalent chromium concentration ranges depicted in the design. Amec Foster Wheeler and Honeywell evaluated options for addressing the hydrocarbon-impacted soil with NJDEP as described in **Appendix J-2**.

This evaluation determined that any VOCs and naphthalene that were below their respective NJDEP inhalation-based residential standards would not pose an unacceptable inhalation risk or cause nuisance odors if the hydrocarbon-impacted soils were consolidated and capped in the Open Space AOC as approved by the NJDEP and indicated in DC 2014-10-28. Hydrocarbon-impacted soils that did not meet the NJDEP inhalation-based residential standards were shipped offsite for disposal.

The following summarizes the disposition of the hydrocarbon-impacted soil encountered at SA-6 South, see Appendix J-2 for additional details:

- Approximately 48,150 CYs of hydrocarbon-impacted soil co-mingled with <1,000 mg/kg of chromium-impacted soils was encountered, stockpiled, and sampled/characterized at SA-6 South.
- Of this, 39,200 tons (approximately 25,750 CYs) of hydrocarbon-impacted material was shipped offsite for disposal for excessive debris or based upon an evaluation of inhalation risk described above.
- The remaining approximately 24,000 CYs of hydrocarbon-impacted soil were consolidated in the Open Space AOC (cap area) at SA-6 South upon approval by NJDEP as described below.

## 5.3 USTS ENCOUNTERED AT SITE 134 AT SA-6 SOUTH

During the course of chromium-impacted soil excavation activities at Site 134 located in the Kellogg Street Development AOC, three, unknown USTs were discovered in succession between June 30, 2014 and July 3, 2014. Upon discovery, Honeywell immediately notified their LSRP, Mr. Peter Jaran, P.E. of Equity Environmental Engineering, LLC (Equity), who is overseeing remediation of the non-chromium AOCs. Upon consultation and oversight by the LSRP, Honeywell authorized Entact to remove the USTs. Entact removed the USTs from the ground on July 1, 2014, July 7, 2014, and July 9, 2014 respectively. Since the tanks were previously unregistered, the LSRP registered the tanks with NJDEP.

Each of the USTs measured approximately 5-feet in diameter and 24 feet in length (approximately 3,500-gallon capacity). Given the length and depth of the USTs, six post-excavation soil samples were collected from 8 feet bgs and analyzed for appropriate parameters for USTs of unknown origin in accordance with the TRSR.

Since the use/former contents of the USTs were unknown, the tanks were treated as Category 2 tanks per NJDEP's "Protocol for Addressing Extractable Petroleum Hydrocarbons" (EPH Guidance) for investigation/remediation purposes.

Additional details concerning the three USTs encountered at Site 134 at SA-6 South are contained in the report *Underground Storage Tank Remedial Action Report* (UST RAR), dated January 2015 prepared by Equity and Amec Foster Wheeler on behalf of Honeywell. The LSRP submitted the UST RAR to NJDEP on November 13, 2015 and issued the Remedial Action Outcome on May 21, 2015.

## 5.4 STRATUM D REPAIR

During the development of the 100% Design, a geotechnical investigation was conducted to determine the elevation and thickness of the meadow mat (Stratum D) that underlies SA-6 South. A Geotechnical Investigation Report (Geotechnical Report) was included as Appendix C of the SA-6 South Chromium Remedy 100% Design Report and provided the details of the characteristics and incidence of Stratum D. In summary, Stratum D is a native marsh deposit consisting of organic silt/clay and peat with an average permeability of 4.8 x 10-7 cm/sec (as reported in the Geotechnical Report). Due to its low permeability, Stratum D plays an important role in preventing vertical migration of contaminants from the fill material overlying Stratum D to the native material aquifer below and establishing hydrogeologic flow characteristics of the shallow groundwater perched atop the Stratum D. No breaches or discontinuities of the Stratum D were documented in the SA-6 South Geotechnical Report.[10] However, several isolated discontinuities of Stratum D within SA-6 South were encountered during excavation.

The 100% Design for SA-6 South did not address Stratum D repair. However, upon encountering the isolated discontinuity in Stratum D in cells 76 to 77 at SA-6 South, Honeywell informed the Special Master and the Parties that the identified discontinuity was discovered and recommended a method of repair of this discontinuity in Stratum D in an email dated November 5, 2014 (see **Appendix S**).

[10] In contrast, the SA-6 North Geotechnical Report, Appendix B to the SA-6 North Chromium Remedy 100% Design Report, documented breaches of the Stratum D in the area known as the JCIA Pit. As a result, the SA-6 North 100% Design required repair of the Stratum D in accordance with Specification Section 02180.8 Special Instructions – Repair of Stratum D on SA-6 North.

The repair of Stratum D at each discontinuity location was necessary to maintain integrity of the Stratum D as a confining layer. Therefore, the Stratum D discontinuities encountered during the excavation were repaired using a GCL in accordance with applicable sections of Specification Section 02180.8 Special Instructions – Repair of Stratum D on SA-6 North, as agreed to by the Parties.

During the course of the remaining chromium-impacted soil excavation activities at SA-6 South, similar repairs to Stratum D were necessary in the following situations:

- On several occasions pilings that penetrated the Stratum D were removed inadvertently in the excavation process
- In several locations, vertical cracks were observed in the Stratum D; and
- In one location, there appeared to be a vertical shear zone resulting in an offset in the Stratum D.

In each Stratum D repair location, GCL was placed over, and extended at least 3 feet beyond the repair area to provide continuity to the Stratum D layer. The location of the repairs was surveyed and noted on the Entact drawing titled SA-6 South Cap Panel Layout 60 mil Textured LLDPE Geomembrane in **Appendix C**.

## 5.5 ADDITIONAL SAMPLING CONDUCTED

Two additional sampling events were implemented as the Chromium Remedy at SA-6 South was being completed. These additional sampling events included:

- Three post-remedial quarterly groundwater sampling events;
- Soil sampling along the bulkhead to further define the area of deferred excavation at Site 073; and
- Soil sampling of anomalous material as described in Sections 8.6 and 8.7.

Each of these additional sampling events are described in the Sections below.

### *5.5.1 Quarterly Groundwater Sampling*

Twelve new monitoring wells were installed within the Development AOC as described in the SA-6 South 100% Design, Appendix D and in CCR Section 7.0. The initial quarterly groundwater sampling of one existing monitoring well located on

Site 163 and the 12 new monitoring wells was conducted from April 6 through 8, 2016 to evaluate the condition of groundwater in the Development AOC following the excavation of the chromium-impacted soils from that area. The second quarterly groundwater sampling event was conducted July 5 through 7, 2016. The third quarterly sampling event was conducted October 4 through 6, 2016. Technical memoranda summarizing each event including the analytical results are included in **Appendix J-3**.

A summary of the analytical results from the three groundwater sampling events is as follows:

- The only instance of hexavalent chromium detected above the laboratory reporting limit of 5.5 µg/L was in the unfiltered and filtered samples of 140-MW-10 during the October 2016 event. Both concentrations were below 70 µg/L total chromium,
- Total chromium was detected above the laboratory reporting limit of 10 µg/L in unfiltered samples at 9 of the 12 locations and in filtered samples at only 2 of the 12 locations.
- Total chromium was detected above the GWQS of 70 µg/L in the unfiltered samples collected from:
    - 125-MW-03 (July only);
    - 134-MW-04 (April only);
    - 140-MW-09 (April, July, and October).
- Total chromium was detected above the GWQS of 70 µg/L in the filtered samples collected from 140-MW-09 only in July and October.

The October sample from 140-MW-09 was also filtered through a smaller filter size (0.1 micron) in addition to the standard filter size (0.45 micron). The objective of the extra filtering was to evaluate whether trivalent chromium detected in the monitoring wells during the previous sampling event is complexing on colloidal particles smaller than the standard 0.45 micron filters. Total chromium was below the GWQS of 70 µg/L in the sample filtered through the smaller filter, indicating that smaller particles are contributing to the higher total chromium results. Since all chromium-impacted soil has now been excavated from the Development AOC at

SA-6 South and monitoring well 140-MW-09 is located within an area of historic fill, differences between total chromium and hexavalent chromium may be associated, at least in part, with non-COPR sources of chromium such as historic fill or other historical industries in this part of SA-6 South.

The groundwater total and hexavalent chromium results represent a marked improvement in groundwater quality as compared to pre-remediation conditions, particularly in the eastern portion of SA-6 South at Site 124, where total chromium concentrations had been as high as 137,000 µg/L and hexavalent chromium concentrations had been as high as 6,400 µg/L. For comparative purposes, Figure 8 from the NJDEP-approved SA-6 South Chromium SRIR/RASR/RAWP and Figure 8 from the SA-6 South Pre-Design Investigation Summary Report as part of the SA-6 South 100% Design showing groundwater total and hexavalent chromium results in groundwater samples collectively from 1997 to 2010 are provided in **Appendix G**.

### *5.5.2 Verification Sampling at Site 073 Bulkhead Deferred Area*

The SA-6 South 100% Design plan for the Site 073 Bulkhead Deferred Area, shown on **Figure 19**, was to excavate the top 4 feet of soils within the deferred area and defer additional excavation below a depth of 4 feet until implementation of the Bayfront Redevelopment Plan when the bulkhead will either be repaired or replaced. Because an approximately 5-foot thick concrete slab was unexpectedly encountered while excavating in this area, DC 2014-5-19 proposed deferral of *all* excavation in this area until implementation of the Bayfront Redevelopment Plan. The proposal to defer remediation was approved by all parties and the Special Master under the SA6 South Consent Decree.

Additional soil borings were conducted in the Site 073 Bulkhead Deferred Area to further investigate the extent of subsurface concrete slabs in the area and characterize hexavalent chromium concentrations in soil in this area for use during the deferred excavation during bulkhead improvements. The additional soil borings in the Site 073 Bulkhead Deferred Area were conducted in two phases with additional details described in **Appendix J-4**. The first phase, consisting of two borings, 073-SB-101 and 073-SB-102, was conducted on May 5 and 6, 2014. The second phase, consisting of four borings, 073-SB-103 through 073-SB-106, was conducted on May 9 and 10, 2016. The locations of all six borings are shown on **Figure 8A** as well as other proximate PDI borings drilled in the deferred area and boring logs are contained in **Appendix H**. The analytical data for hexavalent

chromium are summarized in **Table 6C** and confirm conditions in the deferred area based upon RI and PDI sample results.

# 6.0 DEWATERING AND CONSTRUCTION WATER TREATMENT

## 6.1 GENERAL

Dewatering was conducted to remove groundwater and stormwater from within the excavation areas and to minimize the moisture content of excavated soils. Capture, collection, and treatment of stormwater/surface water that came in contact with impacted soils was also completed. Collected groundwater, stormwater, and surface water was pumped to the CWTP installed on SA-6 North.

For management of stormwater, diversion berms were installed upgradient of excavation areas and within large excavation areas as needed to divert the flow of surface water away from open excavation areas. Additional controls used to minimize the volume of water requiring treatment included extending sheetpile to elevation 10.7 feet based on the National Geodetic Vertical Datum 1929 (NGVD29), sealed jersey barriers, and minimizing the open excavation between the excavation face and the backfill.

Wastewater collected at designated decontamination pads was also collected and pumped to the CWTP for treatment.

## 6.2 EXCAVATION DEWATERING/PUMPING

Excavation dewatering in the Development AOC was accomplished with a combination of shallow well points, and localized sumps and pumps installed above Stratum D and deep wells installed below Stratum D.

### *6.2.1 Well Installation*

Shallow well points and deep wells for dewatering above and below Stratum D in the Development AOC were drilled and installed by B&B Drilling, Inc. (B&B Drilling), a licensed New Jersey well driller, in accordance with N.J.A.C. 7:9D. The shallow well points and deep dewatering wells are shown on the Excavation De-Watering Layout 03/15/16 figure provided by Entact contained in **Appendix C**. Deep dewatering wells within the main SA-6 South excavation area were given the designations DW-1 through DW-5. A sixth deep dewatering well (DW-8) was also installed within the deeper chromium-impacted soil excavation area at Site 163.

As shown in the Excavation De-Watering Layout figure in **Appendix C**, approximately 18 interior shallow well point systems (H-1 to H-18) were installed horizontally or vertically within the excavation footprints as excavation progressed across the phases. A row of perimeter well points were installed along the boundary of the SA-6 South excavation area with the exception of an area where temporary sheetpile was installed. The temporary sheetpile is shown on the Excavation De-Watering Layout figure in **Appendix C.**

Shallow well points were covered under the Temporary Dewatering Permit obtained from NJDEP. Deep dewatering wells constructed through Stratum D (confining layer) required permits for the deep wells. Well records for the deep wells are included in **Appendix E**.

The deep dewatering wells were drilled and installed by B&B drilling using a hollow-stem auger rig. Each deep well was drilled through the Stratum O/D layer to a total depth of up to 50 feet bgs, 32 to 33 feet below the top of the Stratum O/D layer. A 6-inch diameter screen and riser pipe were used in the construction of each deep dewatering well. Screen lengths were 25 feet long in each. A 10-inch diameter steel conductor casing was set 1 to 2 feet into the top of the Stratum O/D layer to isolate water above the Stratum O/D layer from that below.

Shallow well points were installed by B&B Drilling. Shallow well points consisted of a 2.5" slotted polyvinyl chloride (PVC) well casing with filter pack placed around the slotted screen and a 1.5" PVC interior drop tube. The well casing was advanced to 2 feet below the anticipated bottom of the excavation or to the top of the Stratum D layer using hollow-stem auger drilling methods. Each well point was equipped with a control valve and was connected to a header pipe (H-1 to H-18) via flexible hoses which connected to the electrically driven vacuum stations. The interior well points system was connected to the header pipes in a staggered row pattern to maximize the radius of influence. The perimeter well points were connected to a common header pipe in a single row.

Well component specifications were submitted by Entact to Amec Foster Wheeler for review and approval prior to installation. Shallow well points within the excavation areas were removed with the excavated soils. Deep dewatering wells were abandoned by B&B Drilling's licensed driller once an adequate amount of backfill

placement and compaction within an area was complete. Abandonment reports are included in **Appendix F.**

To determine the depth of the Stratum D at header locations, B&B Drilling drilled investigatory boreholes at a frequency of one sample per 50 lineal feet of the header pipe and collected core samples from each to determine the actual bgs depth of the Stratum D layer prior to installing interior and perimeter well points. Boreholes were offset approximately 10 feet from the well point location to protect the integrity of the well point. The boreholes were advanced with the drill rig to within 4 feet of the assumed Stratum D layer. The remaining 4 feet were advanced using a 2-foot-long split-spoon sampler to retrieve core samples. The core samples were evaluated by Amec Foster Wheeler to determine if the Stratum D layer was encountered. Soil boring logs are included in **Appendix H**. At the completion of sample collection, the depth of the observed Stratum D layer or termination point of the borehole was recorded and the borehole was grouted. The data collected during the split-spoon sampling event was evaluated to determine the depth at which the dewatering well points would be driven to effectively dewater excavation areas within breaching the Stratum D layer.

### *6.2.2 SA-6 South Dewatering/Pumping System*

The general process for managing water was to prevent water from contacting chromium-impacted fill materials. However, this was not possible for activities performed below the groundwater table and where surface water/stormwater and incidental precipitation fell on active excavation areas, backfill areas, exclusion zones and contaminant reduction zones. Construction water was removed from remediation and support areas and stormwater that contacted chromium-impacted soils was removed using localized sumps and pumps. Sumps were installed at the low point within an excavation area and consisted of submersible pumps placed inside perforated pipe wrapped in geotextile liner and embedded in stone. Sumps were not installed below and did not penetrate the Stratum D layer and were constructed and relocated as needed as excavations proceeded. Stormwater and surface water collected in sumps was pumped to 21,000-gallon settling tanks to remove sediment and then to the CWTP.

The SA-6 South excavation in the Development AOC was dewatered in four phases corresponding with excavation sequencing. Dewatering with shallow well points and deep wells began in an excavation area and/or phase to achieve drawdown in

advance of excavation activities. Thus, shallow well points and deep wells were installed prior to the start of excavation activities to allow adequate time for groundwater removal. Dewatering data for both SA-6 North and SA-6 South is included in **Appendix I**.

## 6.3 CONSTRUCTION WATER TREATMENT PLANT

The CWTP for SA-6 North and SA-6 South was constructed west of the JCMUA Digestion Tanks on SA-6 North. The CWTP was constructed within a secondary containment system for spill prevention. The secondary containment consisted of a 40-mil high-density polyethylene (HDPE) geomembrane overlain with a 6-inch layer of 1-1/2-inch crushed stone. Class A geotextile liner was placed above and below the geomembrane. The 40 mil geomembrane panels were welded in the field. The secondary containment area had a perimeter berm constructed out of geotextile-covered jersey barriers. The CWTP consisted of approximately 300,000 gallons of untreated (influent) storage made up of eight, 21,000-gallon frac tanks manifolded together by flexible hoses and six additional frac tanks during the peak of excavation activities.

The CWTP had a dual treatment train composed of 50-micron and 5-micron bag filters with a maximum throughput capacity of 500 gallons per minute (gpm). Treated effluent water was pumped into the unused JCMUA South Sludge Digestion tank. The digestion tank was fitted with a gate valve to regulate discharge. The tank normally operated in a flow through condition. During precipitation events, the valve was closed and the digester used to provide an excess of 1 million gallons of temporary effluent storage. The effluent was discharged by gravity to the JCMUA wet well. The CWTP base components are shown in **Figure 9**.

The PVSC-required MR-1 and MR-2 self-reporting documents for the CWTP were completed and sent to PVSC each month, reporting for the prior month. The effluent sample analytical results for the monthly samples are summarized on **Tables 3A, 3B, and 3C**. **Table 3B** also shows the chromium analytical results in each effluent sample. The total chromium load discharge limit permitted by PVSC is 11 pounds per day. The discharge limit was not exceeded during implementation of the Chromium Remedy. Chemical treatment to remove chromium from the construction water was not required.

Commissioning and startup test procedures specified in the SA-6 South 100% Design Report were performed prior to initial discharge from the effluent tank. Entact oversaw operations and maintenance of the system during normal work hours. In the event that pumping was required during non-work hours, the system was manually operated by Entact personnel in the same manner as it was during work hours.

Upon completion of the SA-6 South and North Chromium Remedies, the CWTP was decontaminated, disassembled, and demobilized and residual solids and spent media generated as a result of the operation of the CWTP were sent offsite for disposal. Disposal manifests for the CWTP are included in the SA-6 North RAR.

## 6.4 GROUNDWATER LEVEL AND BASELINE GRADIENT MONITORING

The SA-6 South 100% Design Report requires that the groundwater levels within the SA-6 South Open Space AOC are to be maintained at lower levels than both SA-7 to the north and the Development AOC to the south in the post-Remedy condition. If monitoring indicates that this inward gradient is not being maintained, dewatering is to be conducted within the Open Space AOC to maintain compliance with the gradient requirements. The LTMP details the specific post-Remedy monitoring requirements, frequencies, and action steps depending on water level measurements.

Shallow groundwater levels were monitored within the SA-6 South Open Space AOC along the border with SA-7 SCB using three piezometers installed during the SA-7 remedy along the southern side of the SA-7 SCB wall as shown on **Figure 10**:

- 115-E1A-SO;
- 115-W3-SO; and
- 115-W5-SO.

Along the southern side of the SA-7 SCB wall, the standpipes that monitor perimeter pools S1 through S4 were utilized to determine the head against the north side of the SA-7 SCB wall. Elevation 4.0 feet, based upon the NGVD29 datum, is the lowest head elevation within the SA-7 site-wide underdrain system. Honeywell has installed water-level monitoring points within SA-7, which will be used in the determination of whether there is an outward gradient from SA-7 towards SA-6 South.

The SA-6 South 100% Design Report detailed the installation of 5 pairs of new piezometers along the SA-6 South hydraulic barrier. These piezometers allow long-term monitoring of the hydraulic gradient of the shallow groundwater zone between the Open Space AOC and the SA-6 South Development AOC. The 10 piezometers are:

- 124-PZ-11;
- 124-PZ-12.
- 124-PZ-13
- 124-PZ-14
- 124-PZ-15
- 124-PZ-16
- 124-PZ-17
- 124-PZ-18
- 124-PZ-19; and
- 124-PZ-20.

The locations of the 10 piezometers are shown on **Figure 10**. At each piezometer pair location, one piezometer is located inside of the SA-6 South hydraulic barrier and the other on the outside of the hydraulic barrier. The piezometers were constructed of 4-inch diameter stainless steel casing with a 5-foot-long screen set just above Stratum D. Record Drawing construction diagrams for the piezometers are contained in **Appendix E.**

Following installation of the geomembrane portion of the cap and initial drawdown of the contingent groundwater system, Amec Foster Wheeler conducted initial interim groundwater level monitoring during the 12-month transition period on a bi-monthly basis. In accordance with the LTMP and Groundwater Level Monitoring Plan, Honeywell provided notice to the Parties that long-term groundwater monitoring activities at SA-6 South were being initiated in November 2016 in correspondence dated November 7, 2016 (see **Appendix J-3**). To supplement the manual groundwater measurements to monitor the hydraulic gradient within the SA-6 South Open Space AOC compared to outside of it, data loggers were utilized at 124-PZ-19, 124-PZ-20, 115-W3-SO, 124-PZ-18, 124-PZ-17, MH-2, 115-W5-SO, 124-PZ-13, 124-PZ-14 and 115-E1A-SO. The results of the manual readings taken during the first event per month of the initial interim groundwater level monitoring

are provided in **Table 4**. The results indicate that the piezometers are performing as expected and an inward gradient is maintained at most piezometer locations without active pumping of the contingent groundwater system. However, at the western end of the Open Space AOC along the Hackensack River, the gradient, measured in 124-PZ-19 (exterior) and 124-PZ-20 (interior), is generally outward and fluctuates depending on tidal influences. Since manual water level readings only provide an instantaneous measure of head and do not capture the full tidal cycle, they may not be an accurate means of determining head gradients across the barrier wall at this location. Tidal fluctuations in PZ-20 at SA-6 South are in the range of 1.5 to 2.0 feet in amplitude with little or no lag from the river tides. By comparison, tidal fluctuations in the companion piezometer (PZ-19) are approximately 0.1 feet in amplitude. Tidal influences are not present at any of the other piezometer pairs at SA-6 South. As indicated below, samples from all interior piezometers were collected. The analytical results summarized in the November 7, 2016 correspondence indicates that the filtered and unfiltered groundwater samples from 124-PZ-20 were non-detect for both hexavalent and total chromium.

In response to Plaintiffs' request to establish baseline groundwater quality conditions inside the Open Space Areas, filtered and unfiltered groundwater samples were collected from each piezometer on the interior of both SA-6 North and SA-6 South. The samples were analyzed for total and hexavalent chromium. A summary of this data for the interior piezometers is included in **Appendix S**. The location of the piezometers is shown on **Figure 10**.

# 7.0 MONITORING WELL ABANDONMENT AND INSTALLATION

Selected monitoring wells at SA-6 South were abandoned during implementation of the SA-6 South Chromium Remedy in accordance with the Updated Monitoring Well Abandonment Plan submitted to NJDEP on April 20, 2017, which amended Appendix A-2 of the SA-6 North Chromium Remedy 100% Design Report. Minor DC 2014-6-6- provided clarification as to the wells requiring abandonment.

As discussed in Section 6.4, five pairs of new shallow piezometers were installed on either side of the SA-6 South hydraulic barrier to monitor hydraulic gradients across the barrier. Additionally, 12 new shallow groundwater monitoring wells were installed throughout the SA-6 South Development AOC to allow monitoring of groundwater conditions with respect to chromium in accordance with the Development AOC Shallow Groundwater Monitoring Plan (SGWMP) which was Appendix D of the SA-6 South 100% Design Report. The well logs are included in **Appendix H**.

Existing monitoring wells which are to be maintained in the Open Space AOC were raised to meet proposed grade and re-surveyed with revised Form B certifications included in **Appendix E**. These monitoring wells are shown on **Figure 10** and are the following:

- 115-E1A-SO;
- 115-W3-SO; and
- 115-W5-SO.

**Figure 10** shows the location of three types of monitoring wells at SA-6 South:

- Monitoring wells that existed prior to the start of the SA-6 Chromium Remedy and were abandoned;
- Monitoring wells that existed prior to the start of the SA-6 Chromium Remedy and were retained because they are still needed for ongoing and future groundwater monitoring, including those exclusively needed for non-chromium AOCs; and

- New monitoring wells installed for groundwater monitoring in the Development AOC at SA-6 South in accordance with the SGWMP.

The 12 new monitoring wells installed in the SA-6 South Development AOC are:

- 073-MW-06;
- 073-MW-07;
- 073-MW-08;
- 124-MW-12;
- 124-MW-13;
- 125-MW-02;
- 125-MW-03;
- 134-MW-03;
- 134-MW-04;
- 134-MW-V09R (installed in a non-chromium AOC);
- 140-MW-09; and
- 140-MW-10.

**Table 5** also lists the ID and current status of monitoring wells at SA-6 South.

All well abandonment activities were performed in accordance with N.J.A.C. 7:9D by a New Jersey licensed driller from B&B. Well abandonment records are included in **Appendix F**. Permits for new wells were obtained from the NJDEP by B&B. New well permits, Form A & B wells records, and new well construction diagrams are included in **Appendix E**.

# 8.0 EXCAVATION

Excavation of chromium-impacted soil was performed consistent with the NJDEP-approved RAWP, SA-6 South 100% Design Report, and subsequent DCs applicable to excavation. The excavation at SA-6 South was implemented only in the Development AOCs. Excavation was performed at SA-6 South from October 22, 2013 to June 2, 2016.[11] More details concerning the excavation sequence and schedule are provided in Section 8.3. A progression chart was maintained throughout the project that tracked excavation and backfilling operations showing zones for work sequence and quality control and was reviewed with all Parties at routine progress meetings/conference calls and was provided in the Monthly Progress Reports **(Appendix S)**. As excavation progressed, Honeywell periodically submitted to all Parties documentation of completion of portions of the excavation operations in accordance with the SA-6 South Standard Operating Procedure - Confirmation of Excavation Limits, dated March 3, 2014 (and including Honeywell's April 24, 2014 letter and attachments) for acknowledgement by the Special Master prior to commencing backfilling. The excavation completion correspondence is included in **Appendix S**. Record Drawings for excavation and backfill work are included in **Appendix C**.

## 8.1 TEMPORARY EXCAVATION SUPPORT

Temporary excavation support consisting of sheetpile was installed as shown on SA-6 South Temporary Support of Excavation Plans (S-501 to S-504) as prepared by Honeywell's geotechnical consultant, MRCE, and in accordance with SA-6 South 100% Design Report Specification Section 02150 to stabilize certain portions of the excavation areas adjacent to roadways or other critical infrastructure. The temporary excavation support was removed when possible. Areas where the temporary excavation support remains are shown on the Entact drawing titled "As Built Restoration Plan" in **Appendix C**. The temporary excavation support systems consisted of 2807 Hoesch Larssen Z sheetpile installed at the following locations:

[11] Declaration #1 describes the excavation period as October 22, 2013 to December 22, 2014. The time period described in this CCR includes the excavation of areas of Site 163 originally intended for in-situ treatment (see Section 12), and excavation of anomalous materials at 60 Kellogg Street (see Section 8.7) which came after the issuance of Declaration #1.

| SA-6 South Excavation Area |
|---|
| Site 124 – Jughandle at Route 440 |
| Site 140 – Kellogg Street |
| The property boundaries between Site 163 and Site 073 and Site 134 |
| Site 163 Development AOC – Additional Deeper Excavation |

The Entact Quality Control Engineer monitored the temporary excavation supports for horizontal deflection during excavation. The SA-6 South 100% Design Report also mandated the need for vibration monitoring when sheeting was being driven at the Route 440 jughandle and in close proximity to underground utilities. Vibration monitoring is discussed further in Section 10.2.

## 8.2 EXCAVATED SOIL MANAGEMENT

Excavated soil was managed onsite in accordance with the NJDEP-approved SMP and the approved soil erosion and sediment control plan. Prior to the start of the Chromium Remedy, as part of the PDI, post-excavation equivalent samples were collected and boring locations were surveyed (see the PDI Results and Mapping Report in Appendix A of SA-6 South 100% Design Report). The post-excavation equivalent samples established the horizontal and vertical limits of the chromium-impacted soils and, thus, defined the extent of the excavations for most of the site. Additional post-excavation sampling was required to confirm excavation limits upon encountering isolated incidences of anomalous material under the office portion of the 60 Kellogg Street building south of the 20 mg/kg line delineated during the PDI, and along isolated locations of excavation sidewalls or bottoms at Sites 073, 125, 134, and 140 as documented in Section 8.6. Other than these instances, the PDI allowed for the excavation limits of soils exhibiting hexavalent chromium >20 mg/kg to be more definitively determined during the design phase and implemented in the field and is a process that has been accepted by the NJDEP in the RAWP and has been implemented successfully by Honeywell at other sites. Additionally, considering the PDI samples as post-excavation equivalent samples minimized the collection of traditional confirmatory samples following completion of excavation, and eliminated the associated logistical and scheduling impacts.

The PDI sample hexavalent chromium results also established the designation and final disposition of the excavated material. Entact adopted four designations for

tracking and management purposes based upon their hexavalent chromium concentrations as follows:

- **A Material**: <20 mg/kg hexavalent chromium;
- **B Material**: 20 to 240 mg/kg hexavalent chromium;
- **C Material**: 240 to 1,000 mg/kg hexavalent chromium; and
- **D Material**: >1,000 mg/kg hexavalent chromium.

As provided in the SMP and SA-6 South 100% Design Report:

- **A Material** was stockpiled and tested to confirm its designation and, if confirmed, reused as backfill. If sample results of the A Material stockpiles, or portions of stockpiles, indicated one of the other designations, then the material represented by such samples was managed accordingly. **Table 9** is the Stockpile Tracking Table.
- **B Material** was consolidated in either the SA-6 North or SA-6 South Open Space Areas.
- **C Material** was consolidated in the SA-6 South Open Space AOC only.
- **D Material** was stockpiled and tested to verify whether the sample exceeded 1,000 mg/kg for hexavalent chromium. If confirmed, the material was shipped offsite for disposal. If sample results of the D Material stockpiles, or portions of stockpiles, indicated one of the other designations, then the material represented by such samples was managed accordingly.

As part of the means and methods developed by Entact, the excavation in the Kellogg Street Development AOC was divided up into 156 15-foot wide cells for tracking, management, and reporting purposes (see Entact Figure 1.3 Excavation Cell Layout in **Appendix C**). Drawings C-112 – C-120, Chromium Excavation Interval drawings (included in this CCR as **Figures 7A-7G** and entitled "Waste Classification Sample Locations Chromium Sampling Interval [X]"), delineated the limits of each type of waste material. Based upon the PDI data, these drawings show four soil designations depending on the hexavalent chromium concentrations. These area designations allowed Entact to segregate and manage the excavated material as they were encountered within the cells as excavation progressed. The

PDI sample results established the elevations to which excavation was to be performed for an excavation cell or general area, with the understanding that if Stratum D (i.e., "meadow mat") was encountered or suspect material identified, the excavation could be halted at a shallower depth or expanded as necessary. For the reasons stated in Section 5.4 regarding the need to maintain the integrity of Stratum D, the excavations did not extend vertically below Stratum D.

Excavation was performed using hydraulic excavators directly loading into off-road articulated dump trucks (end dumps) to transport to designated on-site stockpiling areas. The end dumps did not leave SA-6 South, and were decontaminated if they were travelling out of an exclusion zone. The excavators were equipped with GPS equipment manufactured by Trimble®. Entact loaded X, Y, Z coordinates of the designed excavation limits into the GPS system and a transponder was attached to the bucket of the machine enabling the operator to precisely excavate in real-time to the design limits. Additionally, using the GPS and known coordinates differentiated the extents of the designation of various soils as shown on Design Drawings C-112 – C-120 based upon the concentration of hexavalent chromium. A summary of the total excavated volume of each waste material is provided in the quantity summary table in Section 1.6.

Stockpiles were placed on plastic sheeting liners at grade. Stockpiles of D Material were covered with plastic sheeting to minimize air-borne dust and stormwater runoff. As provided in the SA-6 South 100% Design Report, excavations and soil stockpiles were protected from flooding to the 100-year flood elevation (10.2 feet) based on the NGVD29 datum by one or more of the options provided in the NJDEP Coastal Area Facilities Act (CAFRA)/Flood Hazard Area (FHA) permit (see Section 15 for more details). Daily inspections of the liners and plastic sheeting were performed to minimize migration of chromium-impacted soils beyond the designated stockpile area.

## 8.3 EXCAVATION SEQUENCING AND SCHEDULE

Excavation in the Kellogg Street Development AOC began in excavation cell No. 1 at the east end of Site 124, adjacent to Route 440, and proceeded west to approximately cell No. 59 at the western side of Site 125. The westward progression of the excavation was halted there due to the presence of the original groundwater treatment plant (GWTP) built at 80 Kellogg Street in Site 140 during the SA-7 chromium remedy. The excavation activities were then shifted to cell No. 153 in Site

073 and proceeded to the east to Cell No. 81. Upon demolition of the GWTP at 80 Kellogg Street in March 2014 and the former ABF Trucking office and warehouse building at Site 140, the central portion of the excavation in cell Nos. 80 to 60 was completed.

The use of Cell designations was not part of the 100% Design, but rather a means and methods approach developed along with the contractor to track and report on incremental excavation progress in SA-6 South due to the large excavation footprint. While these Cell references were included in routine progress reporting, they are not relied upon for this as-built final documentation. All of the requirements of the 100% Design (including but not limited to surveying of excavation limits, surveying of post-excavation soil sampling locations, etc.) were developed for the excavation as a whole, and as such, the as-built information and final supporting documentation within this report is presented relative to attaining excavation requirements established in the 100% Design and not the incremental cells.

Excavation of the shallow chromium-impacted soils (nominally to 4 feet deep) in the Site 163 Development AOC began at the west end of Site 163 and proceeded to the east. Subsequent to completion of the shallow excavation in the Site 163 Development AOC, Honeywell excavated the deeper chromium-impacted soil in the Site 163 Development AOC Non-Deed Notice Area located within Site 163 to the north of the proposed curb line of the Riverside Park, Riverside Drive, and Kellogg Street (see DC 2014-5-6).

Additional excavation occurred within the Kellogg Street Development AOC in cell Nos 105 to 114 on Site 134, and under the 60 Kellogg Street Building slab, outside of the cell designations of the main excavation area, as discussed in Sections 8.6 and 8.7.

A summary of the excavation schedule is provided in the table below.

| Area Excavated | Start Date | End Date |
|---|---|---|
| Kellogg Street Development AOC (cells 1 through 156) and Site 163 Development AOC | October 22, 2013 | December 22, 2014 |

| Area Excavated | Start Date | End Date |
|---|---|---|
| (shallow excavation to 4 feet bgs) | | |
| Additional Excavation Area on Site 134 | November 12, 2014 | December 9, 2014 |
| Site 163 Development AOC Non-Deed Notice Area (deeper excavation) | December 28, 2015 | February 22, 2016 |
| Site 125 60 Kellogg St Building Area | June 2, 2016 | June 2, 2016 |

## 8.4 EXCAVATED MATERIAL (STOCKPILE) TESTING

In accordance with the SMP, stockpiles of A Material were managed onsite and sampled to confirm that the soil was <20 mg/kg for hexavalent chromium. A Material stockpiles ranged from 135 to 2,850 CYs. The volumes within individual stockpiles differed based upon site layout constraints and the contractor's preferences for advancing excavation and overall soil management. Once an individual stockpile was deemed completed, no further soil was added to the location and sampling commenced. Grab samples were collected from each stockpile for hexavalent chromium analysis at a maximum sampling frequency of 1 sample per 250 CYs in accordance with the SMP. If the hexavalent chromium concentration in any sample from a portion of a stockpile was equal to or greater than 20 mg/kg, that portion of the stockpile was isolated from the remainder of the stockpile and consolidated in the Open Space AOC. Stockpiled soil that was verified to contain <20 mg/kg hexavalent chromium, A Material, was approved for re-use as backfill in excavations. This approved-for-reuse A Material is still considered historic fill. At least 6 inches of imported clean backfill was placed over the reused A Material as needed to achieve the design grades. An institutional control (Restricted Area/Deed Notice) for the remaining historic fill soil will be filed in accordance with the NJDEP-approved RAWPs as part of an RAR for non-chromium impacts submitted by Honeywell's LSRP in December 2016.

Excavated soils designated as D Material (>1,000 mg/kg hexavalent chromium) from the PDI soil sampling were managed onsite and sampled to confirm hexavalent chromium levels. Grab samples were collected from each stockpile for hexavalent chromium analysis at a maximum sampling frequency of 1 sample per 250 CYs. If

the hexavalent chromium concentration in a sample from a portion of a stockpile was >1,000 mg/kg, then that portion of the stockpile was designated for offsite disposal as hazardous waste. Portions of stockpiles that were confirmed to be <1,000 mg/kg hexavalent chromium were consolidated under the SA-6 South Open Space AOC.

**Tables 2A and 2B** summarize the hexavalent stockpile sample analytical results.

## 8.5 EXCAVATION EXTENT SURVEYING AND EXCAVATION COMPLETION CONFIRMATION

As discussed in Section 8.2, post-excavation equivalent samples collected during the remedial investigation (RI) and PDI established the horizontal and vertical limits of the chromium-impacted soils and, thus, defined the extent of the excavations at SA-6 South. On January 30, 2012, Honeywell submitted a request and justification for a variance in post-excavation sidewall and bottom sample frequencies for SA-6 South to the default frequency mandated in the TRSR. NJDEP approved the alternative post-excavation sidewall and bottom sample frequencies in a letter, dated February 16, 2012. Excavation was expanded beyond the limits defined by the PDI samples in two locations due to visual identification of anomalous material requiring additional horizontal and vertical delineation samples to define the excavation limits for the expanded areas as discussed in Sections 8.6 and 8.7. The PDI sample data are included as **Appendix A** to the SA-6 South 100% Design and the location of the PDI samples are shown on **Figure 1.2**, Excavation Confirmation Points, in **Appendix C** to this CCR.

**Tables 6A and 6B** provide the hexavalent chromium concentrations for the post-excavation samples collected in the expanded excavation areas. EDDs for these samples were submitted to the NJDEP's electronic mail site on April 1, 2016. A copy of the confirmation email message from the NJDEP acknowledging submittal of the EDD is included in **Appendix B**.

Upon completion of excavation in each cell, the horizontal and vertical extent of the excavation limits were surveyed.

Honeywell periodically submitted excavation completion documentation to the Special Master and Plaintiffs prior to commencing backfilling. See **Appendix S**.

The submittals summarized the activities undertaken to complete the excavation and included the following Engineer's certification:

> "Amec inspectors certify to the best of our technical ability that impacted soils as defined in the 100% Design Report have been removed and that the requirements to allow backfilling had been met."

Honeywell also noted, where applicable/appropriate, that the excavation in the referenced cells terminated [by depth] in the Stratum D and provided an Excavation Bottom Map that included the surveyed post-excavation bottom elevations for the cell(s). In addition, Honeywell provided an updated figure depicting the 156 cells comprising the SA-6 South excavation that was used as an excavation progress chart, attached a figure of the excavation cells, and included an excavation bottom map. Honeywell further stated that the contractor was ready to backfill the respective cells. During the course of the excavation, the Special Master acknowledged receipt of Honeywell's submittals and the notification that the contractor was ready to backfill the respective cells.

Surveying of the final "as-built" horizontal and vertical extent of the excavations was conducted by Maser Consulting P.A. (Maser) of Marmora, New Jersey. R. Thomas Hugg, a New Jersey Professional Land Surveyor, certified record drawings surveyed by Maser. Record Drawings are discussed and presented in Section 19.

Maser also surveyed the position and elevation of each PDI post-excavation equivalent soil sample to verify that the excavation was carried to or beyond the confirmatory points and tabulated the survey information. The tables are provided in **Appendix C**. Three sets of tables are provided as follows:

- **Set 1**: Eastern portion of the Kellogg Street Development AOC excavation area starting at Route 440, west of the Route 440 ROW Deferred Area (Deed Notice Area 2), moving west, including cell Nos. 1 to 58;
- **Set 2**: Remainder of the Kellogg Street Development AOC excavation area up to the Site 073 Bulkhead Deferred Area (Deed Notice Area 4), including Area 41, Lens Area and cell Nos. 59 to 153; and
- **Set 3**: Shallow and deep excavation areas at the Site 163 Development AOC labeled Attachment B-3 in **Appendix C**.

There are three tables in Sets 1 and 2 as follows:

- Table 1.0 provides the coordinates of the PDI bottom samples and a comparison of the actual excavation elevation to the targeted (design) elevation at the established PDI bottom sample locations;
- Table 2.0 tabulates the design elevation and final excavation elevation at the center points of the excavation cells; and
- Table 3.0 provides the coordinates of the PDI sidewall samples and a comparison of the actual excavation elevation to the targeted (design) elevation at the established PDI sidewall sample locations.

Set 3 includes only equivalent Tables 1.0 and 3.0 for the Site 163 Development AOC excavation (Table 2.0 is not included because the excavation cells were not extended into Site 163).

## 8.6 ANOMALOUS MATERIAL SAMPLING

The SA-6 South 100% Design Report indicated that additional post-excavation sampling may be required if certain field conditions indicated the need to extend excavations beyond the identified limits, as determined by the onsite Construction Manager or designee or Honeywell's Remediation Manager. Conditions specified in the SA-6 South 100% Design Report that would trigger the need for additional post-excavation sampling included:

- Field observations indicating that an area previously characterized as clean shows evidence of contamination. In that event, sampling may be conducted to help identify the source and assess the impact;
- Observations that were not consistent with soil conditions characterized by the samples that were collected during the RI and PDI;
- Observations of chromium blooms on the surface of soils previously thought to be clean; and
- Other field conditions which suggest chromium impacts may extend outside of the previously defined limits.

Material meeting one or more of the trigger criteria is referred to as anomalous material in this CCR. Anomalous material was visually identified as potentially chromium-impacted soil at several locations in the excavation sidewall at the previously delineated horizontal extent of the >20 mg/kg hexavalent chromium impacted soils. At such locations, Amec Foster Wheeler collected a sample of the visually-impacted material. Additional details on the sampling are included in **Appendix J-5**.

Three locations in the Development AOC where anomalous material was visually identified and sampled included the southern excavation sidewall on Site 125 and two locations on the southern sidewall on Site 140 as shown on **Figure 11**. **Table 6B** shows that the hexavalent chromium results were <20 mg/kg; therefore, no additional excavation or sampling was required for these three locations. The cell references corresponding to the three anomalous material samples are:

- 140-SB-107: Cell 77
- 140-SB-108: Cell 70
- 125-SB-306: Cell 49

One additional location in the Development AOC where anomalous material was observed was in the sidewall and bottom of the western portion of the excavation at Site 134. The visually anomalous material was a thin lens observed just above the Stratum D. Three samples were collected and analyzed by Accutest for hexavalent chromium in the sidewalls of this area as excavation advanced to the west, and results reported >20 mg/kg for hexavalent chromium. Soil borings were conducted to delineate the extent of elevated hexavalent chromium concentrations as shown on **Figure 12**. Additional delineation details are included in **Appendix J-5**. Soil borings logs are included in **Appendix H**. The results of the samples are included on **Table 6A** and were utilized to determine the expanded excavation limits.

During excavation at Site 073, a potentially chromium-impacted 1-foot thick concrete slab was observed lying immediately below the ground surface at approximately 1 to 2 feet bgs at the location shown on **Figure 13**. The stained side of the concrete slab was in contact with underlying soils. The stained concrete was broken up and removed for subsequent offsite disposal with D Material. Two post-excavation sidewall samples were then collected from approximately 3 feet bgs from

the soils underlying the stained concrete and analyzed for hexavalent chromium. Results are shown on **Table 6B** and were <20 mg/kg for hexavalent chromium.

All sampling and analysis of samples was performed in accordance with the Data Management Plan combined for both the SA-6 South and SA-6 North Chromium Remedies included as Appendix H of the SA-6 North Chromium Remedy 100% Design Report. EDDs for final (<20 mg/kg for hexavalent chromium) post-excavation samples were submitted to the NJDEP as documented in **Appendix B**.

Section 8.7 provides a separate discussion on one other area where anomalous material was visually identified and sampled during the demolition of the remaining portion of the 60 Kellogg Street building on Site 125.

## 8.7 ANOMALOUS MATERIAL AT SITE 125 UNDER 60 KELLOGG STREET BUILDING SLAB

A limited quantity of anomalous material was observed in shallow soils within the 60 Kellogg Street building footprint during the demolition activities on April 29, 2016. Once the raised concrete building slab was removed, it was noted that timber piles were present below the slab. The demolition contractor was directed to cut off the tops of the timber piles, thus, they excavated some soil adjacent to the piles to expose the approximately top 2 feet of pile to allow for cutting them off with a chain saw. Between two such piles, a small amount of granular material with a yellowish color mingled with soils was observed at elevation +7.4 based on the NGVD29 datum, which was approximately 2 to 2.5 feet below grade (**Figure 8B**). A sample (125-SB-307) of this yellowish granular material/soil was collected for analysis of hexavalent chromium. The hexavalent chromium concentration of the sample was 10,100 mg/kg, confirming the material was COPR.

As discussed in Section 8.2 above, the anomalous material under the office portion of the 60 Kellogg Street building was located south of the 20 mg/kg line delineated during the PDI. The incidence of the COPR at the 60 Kellogg Street building is isolated from other observed locations of COPR in the northern and eastern parts of site. Thus, it appears that this isolated instance of COPR was associated with previous grading activities prior to construction of the building.

Upon receipt of the analytical results of the yellowish granular material/soil sample, Amec Foster Wheeler developed an excavation plan in compliance with the SA-6 South 100% Design Report for this material on behalf of Honeywell as detailed in **Appendix J-5**. Honeywell submitted the excavation plan to all Parties on May 17, 2016. Parties verbally approved the proposed excavation plan at the All Parties call on May 25, 2016.

Honeywell implemented the excavation on June 2, 2016 in accordance with the approved excavation plan. The final excavation limits and sample locations are shown on **Figure 8B** and on a Record Drawing C-111 Excavation Plan contained in **Appendix C**. The analytical results are summarized on **Table 6D** and show that hexavalent chromium concentrations at all post-excavation samples were <20 mg/kg. Approximately 54 CYs were excavated and placed in roll-off boxes for subsequent offsite disposal as hazardous waste (see Section 8.8).

Once the analytical results confirmed that the hexavalent chromium concentrations were <20 mg/kg in post-excavation samples, the excavation was backfilled with clean imported fill material. Additionally, the tops of the remaining timber piles were then exposed by removing surrounding soils to confirm there are no additional isolated locations of anomalous material adjacent to any other piles.

Once the preliminary analytical results of the post-excavation soil samples were obtained by Amec Foster Wheeler and reviewed with Honeywell, Honeywell submitted the results and a summary of the excavation plan to All Parties on May 17, 2016, which the Parties and Special Master approved on May 25, 2016. Subsequently, Honeywell submitted the standard certification email, including an as-built survey and tabulated coordinates of the finished excavation at the bottom and sidewall sample locations, on June 28, 2016, after the analytical results were validated.

## 8.8 OFFSITE TRANSPORTATION AND DISPOSAL

D Material (>1,000 mg/kg for hexavalent chromium) was loaded into tri-axle dump trucks and shipped offsite as hazardous waste to a rail transfer station, owned by Horwith Leasing Company LLC., in Northampton, PA. No confirmed D Material (>1,000 mg/kg for hexavalent chromium) was characterized as non-hazardous waste. Therefore, all confirmed D Material (>1,000 mg/kg for hexavalent chromium) designated for offsite disposal was transported to the contracted disposal facility,

Heritage Environmental Services, in Indianapolis, Indiana. Approximately 33,000 tons of hazardous soils were disposed of offsite. Hazardous waste manifests and certificates of disposal are included as **Appendix K**.

Trucks were lined with synthetic liners which closed over the loads near the truck scales before leaving the work zone. Dump truck bodies were equipped with road covers which were closed over the liners before leaving the project site.

Initially, trucks were decontaminated at the contamination reduction zone, and washed in a designated truck wash zone before leaving the site and entering the public roadways. Chromium-impacted waste was transported by truck to eastern Pennsylvania where it was trans-loaded into gondola railroad cars. Gondola cars were lined with synthetic liners to contain the chromium-impacted waste during rail transport. The chromium-impacted hazardous waste was transported to Heritage Environmental Services or Clean Earth (only the 54 CYs of excavated material from the 60 Kellogg Street building footprint placed in roll-offs) for treatment and disposal. **Appendix K** includes disposal manifests.

As seen on **Tables 7A through 7H,** one concrete sample (124-WC-C14-021114) exhibited elevated copper and two concrete samples (124-WC-C29-092314 and 124-WC-C30-092314) exhibited elevated dieldrin. Because of the copper and dieldrin results in this concrete material exceeded the NJDEP most stringent criteria to which it was compared, Honeywell shipped this material offsite for disposal as non-hazardous waste to the New Jersey Meadowlands Commission Landfill. The total amount of concrete shipped offsite was 815 tons.

The offsite disposal facilities for chromium-impacted material were:

| Disposal Facility | Material Type and Source | Waste Classification | Weight (Tons) |
|---|---|---|---|
| Heritage/Clean Earth | Confirmed Chromium-Impacted D Material Excavated from the Development AOC | Hazardous | 33,000 |
| Bayshore Recycling | Petroleum soil co-mingled with Chromium-Impacted A & B Material and Debris Excavated from the Development AOC | Non-hazardous | 8,900 |

| Disposal Facility | Material Type and Source | Waste Classification | Weight (Tons) |
|---|---|---|---|
| Middlesex County Landfill | Petroleum soil co-mingled with Chromium-Impacted A & B Material Excavated from the Development AOC | Non-hazardous | 27,000 |
| New Jersey Meadowlands Commission Landfill | Copper-dieldrin impacted concrete Excavated from the Development AOC (see Section 9.3) | Non-hazardous | 815 |
| Bayshore Recycling | Debris | Non-hazardous | 315 |

# 9.0 EXCAVATION BACKFILLING, BACKFILL COMPACTION, AND BACKFILL COMPACTION TESTING

Backfilling within the excavations in the Development AOC included the spreading/placing, compacting, and grading of backfill materials that met the Specification 02315 and were approved by the EOR.

## 9.1 BACKFILL SOURCES

Sources of imported backfill from offsite locations were tested and analyzed to confirm the material met the NJDEP's definition of clean fill in accordance with the TRSR and did not contain hexavalent chromium above 1 mg/kg. Tested and approved imported backfill sources for SA-6 South included:

- Approximately 1,000 CYs of surplus clean gravel that remained at SA-7 after the completion of the SA-7 sediment remedy;
- Approximately 17,000 CYs of surplus clean fill material from a capital improvement construction project on SA-5 NJCU located on the east side of Route 440;
- Approximately 69,000 CYs of common borrow material from a construction site in Summit, New Jersey; and
- Approximately 195,000 CYs of purchased fill materials from the following quarries licensed by NJDEP:

| Source | Quarry | Material Type | Approximate Volume Imported (CYs) |
|---|---|---|---|
| Weldon | Watchung | Screenings | **82,200** |
| Weldon | Watchung | Quarry Process | **9,300** |
| Weldon | Watchung | DGA | **300** |
| Weldon | Lake Hopatcong | Screenings | **5,300** |
| Tilcon | Mount Hope | DGA | **17,700** |
| Tilcon | Mount Hope | 1.5" Stone | **3,000** |
| Tilcon | Mount Hope | 3/8" Stone | **300** |
| Tilcon | Mount Hope | 6"-18" Riprap | **100** |
| Tilcon | Mount Hope | 2.5 Stone | **500** |
| Liberty Aggregates | Liberty | I-5 Structural Fill | **5,000** |
| Tilcon | Mount Hope | I-8 Structural Fill | **7,000** |

| Source | Quarry | Material Type | Approximate Volume Imported (CYs) |
|---|---|---|---|
| Tilcon | Mount Hope | 575 Stone | **9,900** |

Additionally, the following sources of onsite backfill material were tested and approved in accordance with the SMP to confirm they met the reuse criteria:

- Approximately 18,000 CYs of onsite recycled concrete tested and approved for reuse; and
- Approximately 46,000 CYs of excavated A Material tested and approved for reuse.

## 9.2 BACKFILL TESTING

Backfill quality control testing was performed as indicated in the SA-6 South 100% Design Report. One sample for chemical analytical testing was required for each 5,000 tons brought onsite to confirm the imported backfill material met the definition of clean fill in the TRSR. Analytical results for imported backfill used in the Development AOC were compared to the Residential Direct Contact Soil Remediation Standards. In addition, the SA-6 South 100% Design Report required imported fill to have a hexavalent chromium concentration of ≤1 mg/kg.

Entact collected samples of imported fill material for analysis, other than hexavalent chromium, by their subcontracted analytical laboratory, ChemTech Laboratories of Mountainside, New Jersey. Samples were submitted to Eurofins (a.k.a. Lancaster Laboratories) of Lancaster, Pennsylvania for analysis of hexavalent chromium by USEPA Method 7199.

In accordance with the SA-6 South 100% Design Report, imported fill samples were analyzed for (see **Appendix L**):

- Target Compound List (TCL) VOCs by SW8260
- TCL Semi-volatiles by SW8270
- EPH by NJEPH 10/08
- Target Analyte List (TAL) Metals by SW6010B/7471
- Pesticides by SW8081

- Herbicides by SW846 8151
- Polychlorinated Biphenyls by SW8082
- Cyanide SW846 9012
- Hexavalent Chromium by USEPA 7199
- Synthetic Precipitation Leaching Procedure (SPLP) Metals by SW6010B/7471 only for those contaminants that exceed Impact to Groundwater (IGW) standards.

Clean fill certifications, certifying that the soil material was virgin and free of hazardous material and contaminants were obtained from the suppliers of the imported source location and are included in **Appendix L**. Specification 02315.2.13 also required one sample of each source of imported fill to be tested for maximum dry density and optimum moisture content as determined by American Society of Testing Materials (ASTM) D 698 (Standard Proctor). The Proctor results were used by the technician conducting the compaction testing in the field to determine the degree of compaction based upon a percentage of the Proctor as specified (see Specification 02315.3.12 and **Table 10**) in the SA-6 South 100% Design Report.

## 9.3 CONCRETE TESTING

Onsite sources of recycled concrete included:

- Approximately 5,000 CYs of crushed concrete generated from demolition of the sedimentation basin at SA-6 North; and
- Approximately 13,000 CYs of concrete building foundations and slabs encountered in excavations at SA-6 South.

All concrete materials were evaluated for suitability for onsite reuse through sampling and analysis. The SMP allowed concrete meeting NJDEP reuse parameters to be reused onsite as backfill in excavations or placed in the Open Space AOC with consolidated chromium-impacted soil. Concrete material that was not suitable for onsite reuse was shipped offsite to an approved waste facility.

Concrete sampling and analysis was conducted in accordance with the September 2013 CASP. The procedures outlined in the CASP were in accordance with the

NJDEP guidance document titled *Guidance for Characterization of Concrete and Clean Material Certification for Recycling*, dated January 12, 2010 and the NJDEP guidance document titled *Alternative and Clean Fill Guidance for SRP Sites*, dated December 29, 2011 – Version 2.

Concrete samples were collected at a maximum sampling frequency of one sample for every 250 CYs of concrete. Representative samples were obtained from the concrete cross-section (including the exposed surfaces) and crushed to fit into laboratory-supplied sample containers. A total of 18 concrete samples were collected from the crushed concrete generated from demolition of the sedimentation basin. A total of 39 concrete samples were collected from the remaining sources of recycled concrete from SA-6 South. Thirty-seven additional concrete samples were collected for synthetic precipitation leaching procedure analysis for those instances when the IGW standards were exceeded. Concrete that met the reuse criteria was sized to 3-inch minus for reuse by Entact in accordance with the SA-6 South 100% Design Report.

Concrete samples were field screened with a PID and collected with a bias towards any instrument or visual contamination. Sample collection, preservation and handling was performed in accordance the NJDEP Field Sampling Procedures Manual, August 2005, updated 2011 (NJDEP, 2005) and the Quality Assurance Project Plan provided in Appendix H-1 of the SA-6 North Chromium Remedy 100% Design Report.

In accordance with the CASP, concrete samples were analyzed for the same parameters as those tested on imported fill materials. The concrete sample results are included in **Tables 7A through 7H**.

## 9.4 BACKFILLING AND COMPACTION

The SA-6 South 100% Design Specification 02201.2.03 allowed for the use of crushed recycled concrete as bridge lift where necessary to stabilize soft or wet subgrade materials at the bottom of excavations. A Material re-use soil or the offsite sources of clean backfill indicated above in Section 9.1 were placed over the bridge lift to bring the backfill to the appropriate design grades.

Bridge lifts were initially placed in nominal 12-inch lifts and compacted with a minimum of 3 passes of a static steel drum roller as specified in Specification

02201.3.03 and **Table 10**. Vibratory compaction equipment was not used in the bridging lift. Based on the observation of the stability of the lift, the EOR permitted increasing the lift to 18 inches using dozer placement. If the lift was stable, static rolling was initiated. In some locations, it was necessary to defer rolling until up to a 3-foot-thick bridging lift was placed due to excessive dewatering. In other locations geotextile fabric was added between bridge lift layers or on top of the bridge lift to add additional reinforcing and material separation. Subsequent lifts of non-bridge-lift backfill materials were placed at a maximum of 12 inches' thick loose lift and compacted using vibratory smooth-drum rollers to at least 95% of the maximum dry density in accordance with the Specifications 02315.3.11 and 02315.3.12 as detailed on **Table 10**.

Approved-for-reuse A Material (historic fill) was placed and compacted at the bottom of the excavations and buried to the maximum extent possible with at least 6 inches of imported clean backfill as needed to achieve the design grades. The variable nature of this material precluded testing for compaction using the Proctor density methods. The condition of the material was observed, unsuitable materials removed, and compaction conducted in accordance with the specified methodology using 2 to 3 passes of a vibratory roller.

## 9.5 IN-PLACE BACKFILL DENSITY TESTING

The in-place density of the compacted imported backfill materials were verified in the field using a nuclear surface moisture-density gauge in accordance with American Society of Testing Materials (ASTM) D 6938. Vertical V-Northeast, Inc. of Rahway, New Jersey, was subcontracted to Entact and performed compaction testing at SA-6 South. Testing was performed in accordance with the SA-6 South 100% Design Report at a testing frequency of one test per 2,500 SF per compacted lift. Figures showing the in-place density testing locations at every 2,500 SF in the SA-6 South main excavation cells and tables ("Field Density Test Summary Log") summarizing the in-field density test results for each lift at these testing locations are provided in **Appendix M.** The coordinates of the testing locations and elevations of each associated lift are also provided on the Field Density Test Summary Logs. Test locations where test results showed the in-place density of the backfill material of that lift was less than 95% of the maximum dry density are also shown highlighted on the Field Density Test Summary Logs. Such lifts were re-compacted and re-tested until the in-field density results met the criterion.

# 10.0 CONTAINMENT SYSTEM CONSTRUCTION

In accordance with the SA-6 South Consent Decree and the SA-6 South 100% Design Report, the Chromium Remedy for the Open Space AOC includes a containment system consisting of a hydraulic barrier, a RCRA-equivalent cap (Cap), and a contingent groundwater extraction system to provide hydraulic control of shallow groundwater. The objectives of the containment system are to physically separate chromium-impacted soils within the Open Space AOC from the adjacent Development AOC and SA-7; to prevent the migration of contaminated groundwater out of the Open Space AOC; and to limit infiltration of precipitation into the chromium-impacted soil within the Open Space AOC.

Major containment system construction activities included:

- Installation of Hydraulic Barrier;
- Vibration Monitoring
- Consolidation of Chromium-Impacted Soil Excavated from the Development AOC;
- Construction of the Contingent Groundwater Extraction System;
- Surcharging of soils in the Open Space Cap AOC; and
- Construction of the Cap in the Open Space AOC.

## 10.1 HYDRAULIC BARRIER INSTALLATION

The hydraulic barrier at SA-6 South consisting of steel sheetpile with sealed joints was installed around the eastern, southern, and western perimeters of the Open Space AOC in accordance with the SA-6 South 100% Design and DCs 2013-8-14, 2013-9-12, 2015-5-29, and 2015-08-20. The hydraulic barrier is connected to the existing SA-7 SCB on the northern boundary of SA-6 South and keyed into the meadow mat (Stratum D) or Stratum O. The western hydraulic barrier was installed approximately 38 feet inboard of the bulkhead. The chromium-impacted soil area between the hydraulic barrier and the bulkhead is the Site 073 Bulkhead Deferred Area (Deed Notice Area 4) and will be excavated during implementation of the Bayfront Redevelopment Plan following replacement of the existing bulkhead.

The barrier wall was installed using an ABI Mobileram with a high frequency vibratory driver. Prior to driving the sheets, pre-trenching was conducted to approximately 4 to 5 feet bgs along the hydraulic barrier alignment to remove debris that could inhibit sheetpile driving. Material removed during the pre-trenching was consolidated in the Open Space AOC. The trench was backfilled with crushed recycled concrete.

The sheet piling was 1907 Hoesch Larssen Z Series sheetpile. The length of sheets varied along the alignment subject to the final design top elevation, the depth to Stratum D, and temporary support stability requirements. Sheets were fabricated and supplied to the site at specific lengths based upon the design profiles. The majority of sheetpile was delivered to the site in welded pairs. Single sheets and fabricated special sheets were used at specific locations. Sheet welding and epoxy coating was conducted by Durabond at their Steelton, Pennsylvania facility. Specification 02180.6, as documented on **Table 10,** required application of an epoxy coating from the top of the sheet to a length equivalent of 2-feet into the Stratum D. Where longer sheets were used for structural purposes (i.e. to facilitate temporary excavation) the section of sheet below the 2 feet key did not require coating. The intent of the epoxy coating is to extend the life of the hydraulic barrier.

Independent QA was performed at the Durabond facility to verify conformance with the specified requirements.

To meet the permeability objectives of the hydraulic barrier, the field joints were sealed with a cement bentonite grout between Station 0+00 and Station 17+80 (east wall and eastern portion of south wall) and with hydrophilic sealant between Station 17+80 and Station 25+86 (west portion of southern wall and west wall). The type of sealant was based on the pH in the groundwater along the alignment. Record drawings of the sheetpile plan and profile are included in **Appendix N**.

Supplemental pH testing of groundwater was conducted along limited sections of the hydraulic barrier alignment that were accessible due to building at the time of the design as shown on **Figure 6**. In accordance with the SA-6 South 100% Design either a bentonite grout mix or hydrophilic seal was utilized on the sheetpile depending on the pH of the groundwater.

To achieve a continuous barrier around the Open Space AOC, the hydraulic barrier was connected to the southeast and southwest corners of the SA-7 SCB wall using a grouted connection. These connections were made by drilling a series of 6-inch diameter boreholes at the connection point using a track mounted drill rig fitted with a continuous flight hollow stem auger. The auger was advanced into the Stratum D and a Cement Bentonite grout was pumped from the bottom of the auger to fill the void. The closure section of the sheetpile barrier was then installed prior to the grout setting.

The toe of the wall was designed to key a minimum of 2 feet into the Stratum D or Stratum O. The Geotechnical Investigation Report from Appendix C of the SA-6 South 100% Design Report, was used to develop an elevation profile of the top of Stratum D along the barrier wall. As noted above, the sheets were fabricated and installed based on that design profile. Knowing the elevation of the top of Stratum D from the profile and the length of the sheet at any given location along the barrier wall alignment, the sheets were driven to the prescribed depth bgs (or elevation) so that the bottom of the sheets were keyed at least 2 feet into Stratum D. In many areas of the SA-6 Kellogg Street Development AOC excavation, the excavation was carried down to Stratum D. These areas provided corroboration of the accuracy of the design Stratum D profile and, therefore, confirmed that the sheet length/key and coating length were correct.

For the majority of SA-6 South, the cap to barrier wall profile is above the water table. In some utility corridors, the connection is submerged. Langan Engineering, Inc. (Langan) of Lawrenceville, New Jersey was retained by Amec Foster Wheeler to provide 3rd party QA on the construction of the cap components. In submerged areas, GCL was placed under the geomembrane in lieu of the gas vent layer and a sand bentonite plug was installed against the top of the sheetpile to provide for a low permeability connection. The installation of the connection detail for these areas is discussed in the Geosynthetics Quality Assurance Report prepared by Langan in **Appendix Q**.

## 10.2 VIBRATION MONITORING

The SA-6 South 100% Design Report mandated vibration monitoring when sheeting was being driven proximate to critical subsurface infrastructure or other features

that could be damaged due to vibration. Such areas at SA-6 South are shown on **Figure 14** and included:

- Adjacent to Route 440 on the east side of the SA6 South Open Space AOC; and;
- temporary excavation support installation along the jughandle that connects Route 440 and Kellogg Street at Site 124; and
- Kellogg Street at Development AOC Site 140.

Honeywell's geotechnical engineering consultant, MRCE, developed the vibration limits for these sensitive areas. The Vibration Monitoring Plan (VMP) was prepared by Geocomp Engineering, Inc. in August 2013. This plan stated the maximum vibration limits as well as trigger limits which specified a change in the work approach if met. Seismographs were placed over the utilities at the jughandle and along Kellogg Street to monitor the vibration levels during installation. Vibrations on the building adjacent to Site 124 (440 Diner) were monitored in the basement. The ABI Mobileram operator had the ability to adjust the vibration frequency and total applied energy during driving. If the trigger levels were approached, the operator adjusted the driving parameters to keep the seismograph reading below the vibration limits. Vibration monitoring results are provided in **Appendix O**. Work was preformed per the VMP.

## 10.3 CONSOLIDATION OF SOILS IN OPEN SPACE AOC

The Chromium Remedy allowed for the consolidation of soil excavated from the SA-6 South Development AOC with hexavalent chromium concentrations of 20 to 1,000 mg/kg (B & C Materials) to be consolidated in the SA-6 South Open Space AOC. Additionally, the Chromium Remedy allowed for the consolidation of soil excavated from the SA-6 South Development AOC with hexavalent chromium concentrations of 20 to 240 mg/kg (B Material only) to be consolidated in the SA-6 North Open Space AOC.

The total volume of excavated soils consolidated in the SA-6 South Open Space AOC was approximately 35,000 CYs. The total volume of soils excavated from the SA-6 South Development AOC consolidated in the SA-6 North Open Space AOC was approximately 35,000 CYs. As discussed in Section 5.2, NJDEP approved the

consolidation of petroleum-impacted soils co-mingled with excavated A, B, & C Materials from SA-6 South in the SA-6 South Open Space AOC. Thus, of the approximately 59,000 CYs of material consolidated in the SA-6 South Open Space AOC, approximately 24,000 CYs of that material was petroleum-impacted soils co-mingled with excavated A, B, & C Materials.

Soils placed within the SA-6 South Open Space AOC were compacted as required by Specification 01600 (see **Table 10)** to create a stable subgrade for the capping system. In accordance with paragraph 65(d) of the SA-6 South Consent Decree, debris, or deleterious materials that could interfere with compaction was not placed under the cap. Compaction was typically performed using a vibratory steel drum roller. The subgrade was proof rolled with the roller operating in static mode loaded to provide a 1 ton per square foot (2,000 pounds per square foot), or equivalent, loading to the subgrade. The roller traversed over the subgrade materials until no further significant rutting or deformation of the subgrade was evident. In smaller areas where the roller would not fit (such as adjacent to the hydraulic barrier wall or adjacent to wells or surcharge monitoring instrumentation), a plate compactor was utilized to provide compaction. Subgrade compaction was subject to engineer's approval. Soils that were too wet to compact were either dried or treated with Calciment® to reduce moisture content and increase strength to meet the specified criteria. The grading of the consolidated soils met the grading requirements in the SA-6 South 100% Design Report.

## 10.4 CONTINGENT GROUNDWATER EXTRACTION SYSTEM CONSTRUCTION

The SA-6 South 100% Design originally required a conceptual groundwater extraction design based on vertically-installed wells subject to further evaluation and possible change. Honeywell determined that a trench system would be more effective in the variable fill above the Stratum D. DC 2014-3-25 and an additional 8 minor DCs document the change to the trench design. The collection trench was installed prior to the surcharging program described in Section 10.5 of this report. The contingent groundwater extraction trench location is shown on **Figure 10** and the Record Drawing contained in **Appendix C**. The system will only operate as necessary to comply with the groundwater capture and gradient requirements noted in Paragraph 69 of the SA-6 South Consent Decree.

Specification 02140.3.01 required that the water table be controlled during construction of the cap to maintain an outward gradient towards SA-6 South from

the SA-7 perimeter pools (see **Table 10**). Pumping from the collection trench and other temporary trenches within the Open Space AOC was initiated prior to cap placement to control groundwater levels and terminated once the cap was completed in October 2015. Evaluation of preliminary groundwater level monitoring results in existing shallow wells in the Development AOC indicates that an inward gradient to the SA-6 South Open Space AOC has been created throughout most of the area.

The contingent groundwater system trench consists of 1,700 feet of 8-inch diameter perforated HDPE pipe that was placed running east/west through the center of the Open Space AOC. The HDPE pipe was placed on top of 6 inches (nominally) of clean crushed stone and was covered with additional stone to depths in accordance with the above-referenced DC. Geotextile fabric was placed across the top of the trench to prevent vertical migration of fines into the trench. As shown on the Record Drawing in **Appendix C**, the perforated piping is connected to an extraction manhole located near the western end of the Open Space AOC. Four access manholes are installed along the alignment to provide access for maintenance, if required. A double walled force main runs from the extraction manhole to the GWTP. Electrical and instrumentation conduits were also installed between the pump station and GWTP as shown on the drawing Contingent Groundwater Extraction System, South Cap in **Appendix C**.

The groundwater model predicts that the inward gradient can be maintained by passive means (i.e. without active pumping). In the event it is necessary to implement active pumping, a pump will be installed into the extraction manhole along with the requisite electrical and instrumentation wiring and controls.

## 10.5 SURCHARGE PROGRAM

The existing surface grade of the Open Space AOC generally varied between elevation 8 and elevation 10 based on the NGVD29 datum. The maximum "redevelopment grade" at the Open Space AOC is elevation 21 based on the NGVD29 datum. Engineering calculations indicated that up to approximately 20 inches of settlement could result due to the increased load resulting from the increase in grade. That settlement was estimated to be primarily through consolidation of the underlying compressible Stratum O and Stratum D Soils. A decision was made, based on this potential settlement, to surcharge the site to remove 100% of the Primary Consolidation attributable to the Development AOC grade loading, prior to placement of the cap.

The surcharge program was designed to be completed in a rolling fashion starting from 1S and moving east to 3S (see **Illustration 4**).

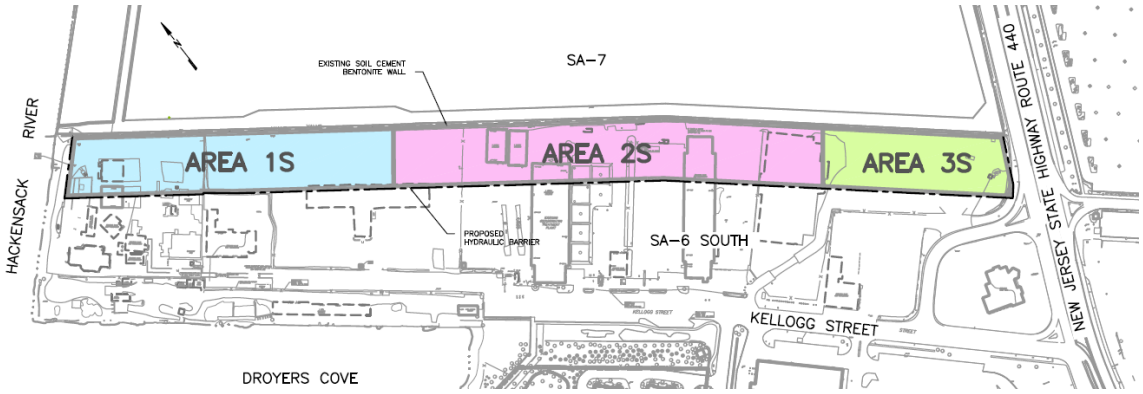

**Illustration 4: Surcharge Loading Plan**

The surcharge loads pile geometry was designed to achieve settlement as a result of primary consolidation in a period of approximately 6 months. Surcharge pile geometry was included in the SA-6 South 100% Design Report. The actual time required for the individual areas was determined by the results of the Surcharge Monitoring Plan. The Surcharge Monitoring Plan was provided in Appendix N of the SA-6 South 100% Design Report.

A Surcharge Monitoring report summarizing the results of the surcharge program for SA-6 South was generated on a monthly basis during active surcharging. The Surcharge Monitoring Report included in **Appendix P** indicates that 100% of primary consolidation was achieved at the monitoring locations.

Upon completion of the analysis and verification by Amec Foster Wheeler that surcharge objectives were met, data packages were sent to MRCE for 3rd party review. The dates of surcharging and 3rd party agreement of completion are:

| Surcharge Area | Initiation Date | Completion Date | MRCE Agreement |
|---|---|---|---|
| 1S | June 2014 | September 2014 | October 27, 2014 |
| 2S | July 2014 | January 2015 | February 5, 2015 |
| 3S | November 2014 | March 2015 | April 24, 2015 |

Following completion of the Surcharge Program, excess surcharge material was removed and the subgrade prepared for deployment of the cap geosynthetics.

## 10.6 CAP CONSTRUCTION

This Section provides a summary of the cap construction and third-party QA testing performed. A full detailed explanation, including step-by-step construction sequencing and procedures, photographs of cap elements, and a full description of QA testing procedures and results is contained in the Langan Cap Geosynthetic Quality Assurance (QA) Report for Study Area 6 South ("Langan Report"), (**Appendix Q).**

The Chromium Remedy included a RCRA-equivalent geosynthetic cap system, including a methane GVL to address the potential release of naturally occurring methane, 60 mil Linear Low Density Polyethylene geomembrane, GDL and cover soils to protect the geosynthetic components and support plant growth. Cap construction proceeded from west to east at SA-6 South, starting on July 20, 2015. The construction of the geosynthetic cap system was completed on November 4, 2015.

The following process was utilized for construction of the cap within the Open Space AOC:

- Verification survey by Maser of the cap subgrade.
- Certification by the installation contractor (ESI) and Langan that the subgrade surface was suitable for geosynthetic deployment;
- Install cap geosynthetics (gas venting layer, geomembrane liner, geocomposite drainage layer) in the Open Space AOC;
- QA/QC of placed geosynthetics;
- Install Warning Layer.
- Placement of protective cover soil;
- Placement of root barrier;
- Placement of imported clean soil of the type required to the design thicknesses and grades; and

- Seeding and or gravel placement to serve as final cover pending redevelopment.

**Figures 15 and 16** graphically portray the Chromium Remedy components including the cap details.

The final design of the Bayfront Redevelopment includes roadways that traverse the Open Space AOC in a North-South alignment. The geosynthetic cap system was designed to accommodate future utilities in the roadways traversing the SA-6 South Open Space AOC. The locations and design of the utility corridors were coordinated with the future Bayfront Redevelopment design and were in accordance with the SA-6 South Consent Decree. The location of utility corridors is shown on **Figure 17**. The liner grades provide a minimum of 3 feet between the Bayfront Redevelopment road surface and the liner. The 3 feet criterion was established by Amec Foster Wheeler based on a conservative approach utilizing Bayfront Redevelopment planned traffic flows and a typical Municipal pavement design that was consistent with the road designation/traffic loadings. In areas designated as future roadways either imported NJ I-5 or NJ I-8 was placed as "Structural Fill under Roadways" above the cap components per Specification 02315.2.05 and **Table 10**.

Upon surcharge completion, the cap subgrade was graded and compacted in accordance with the lines, grades and compaction requirements specified in the SA-6 South 100% Design Report and associated DCs (see **Table 10**). Subgrade preparation was performed between May 11, 2015 and October 9, 2015. To document compliance with the grading requirements, a Construction Control Grid was established consistent with Specification 01460.1.04 and **Table 10**. The Construction Control Grid is included as Figures 1.1 and 1.2 SA-6 South Construction Control Grid in **Appendix C**. Also included are summary tables (Table 1 SA-6 South Open Space Cap Area – Construction Control Grid As Built Summary) prepared by Maser comparing the design grades and actual grades at the Construction Control Grid nodes confirming that all nodes are within tolerance. A topographic survey of the SA-6 South subgrade was prepared by Maser (C-125, 126, and 127, **Appendix C**).

Installation of the cap geosynthetics followed Maser's certification that the subgrade surface conformed to the specified Construction Control Grid. Amec Foster Wheeler provided QA approval of Maser's documented subgrade elevations prior to issuing to

Langan for approval for geosynthetics deployment. In addition, as part of the subgrade approvals, Amec Foster Wheeler provided QA approval of the sand bentonite GCL to barrier wall connections (signed GCL to barrier wall logs are included in Appendix H of the Langan Report [**Appendix Q**]).

The cap geosynthetics were placed between July 20, 2015 and November 4, 2015. The cap geosynthetics included components that were designed to meet the technical requirements of Section 65(a) of the Consent Decree. The cap geosynthetics scope included the following key tasks:

- Subgrade inspection for acceptability prior to geosynthetics deployment,
- Gas Vent/Geotextile and GCL installation over the subgrade and under the geomembrane,
- Geomembrane Installation-60 mil LLDPE,
- Geocomposite drainage/warning layer installation, and
- Warning tape installation.

The top component of the GDL is comprised of a high visibility orange non-woven geotextile liner that met the visibility requirements, but not the printed warning requirements, of the SA-6 South Consent Decree. Therefore, yellow polyethylene direct burial tape, with black lettered warning language, was installed every 5 feet on center on top of the GDL and also on top of the root barrier that was installed 12 inches above the high visibility orange non-woven geotextile.

Honeywell contracted with Langan to provide Independent QA for the SA-6 cap geosynthetics installation. As the Independent QA Engineer, Langan performed the QA activities specified in the Langan Report, including monitoring, field oversight, and documentation. The Langan Report documents the results of the QA Geosynthetic activities conducted during the construction of the cap at SA-6 South by both Langan and Amec Foster Wheeler field personnel. Refer to the Construction Quality Assurance (CQA) Plan prepared by Langan in June 2015 (attached as Appendix B to the Langan Report) for a description of the scope of work conducted by Langan, as well as the roles and responsibilities of the owner, EOR, earthwork contractor, and liner contractor. DCBs and RFIs which were generated subsequent

to the 100% Design, and relevant to the QA scope of work were reviewed and approved by the EOR, and are further summarized in this CCR.

The Langan Report specifically included the following documentation of the cap construction activities:

- Relevant Record Drawings;
- Summary of the various phases of the work observed as part of the QA program;
- Daily QA Reports indicating the work activities completed each day and other pertinent information;
- Daily cap construction forms submitted by the Geosynthetic Installer which included:
    - Repair Reports, Trial Weld Logs, Panel Placement Forms, Seam Control Forms, Destructive & Non-Destructive Test Forms, and Subgrade Approval Forms;
    - Field testing results for fusion welds and extrusion welds;
    - Laboratory testing results for the destructive samples collected (i.e., fusion & extrusion welds); and
    - Photographs depicting daily work activities and the various phases of the capping activities.

The Langan Report certifies that placement of the SA-6 South cap geosynthetics was completed in compliance with the construction design documents (**Appendix Q**).

The Amec Foster Wheeler EOR provided a full-time site Geosynthetics Inspector to inspect materials deployment, installation and documentation for compliance with the SA-6 South 100% Design of the capping system. The Geosynthetics Inspector observed the placement of the GDL cover soil to verify that the soil was placed in accordance with the Earthwork and GDL Specifications (02315 and 02374, respectively) and that the GDL was not damaged or unnecessarily stressed. The Geosynthetics Inspector also observed the fabrication, installation and extrusion welding and vacuum testing of all boots.

QC for geosynthetics installation was provided by Entact and their specialty installer ESI. Entact also contracted with Geotechnics, Inc. to conduct the specified offsite laboratory testing required as part of the capping project, such as destructive seam testing. All ESI field QC and Geotechnics laboratory testing is incorporated into the Langan QA Report and are the subject of the Langan QA Certification. Langan offsite QA laboratory testing was completed by TRI Environmental, Inc. Record drawings of the cap geosynthetics (SA6 South Cap Panel Layout; SA6 South Cap GVL/GCL Layout – Class A Geotextile/Gas Vent Layer/Geosynthetic Clay Liner 01/28/16; SA6 South GDL Layout – Geocomposite Drainage Layer 01/27/16) are included as **Appendix C**.

After completion of the cap, cover soils that are referred to as Horizon B and C soils were placed consistent with the SA-6 South 100% Design Report. Multiple sources of Horizon B and Horizon C soils were identified by Entact and Amec Foster Wheeler. Multiple samples from these sources were tested for geotechnical and chemical analysis to find sources of the cap cover soil materials that met the SA-6 South 100% Design Specification 02315 and DC 2015-9-17, 2016-03-21, and 2016-4-20. The analytical data obtained during the Horizon B and Horizon C source identification process is summarized on the Backfill Sample Comparison to NJDEP Standards table in **Appendix L**.

A woven geotextile root barrier was installed within the landscape areas. At least 6 inches of Horizon C soil was placed immediately above the root barrier and compacted to 90% of the maximum dry density as measured by ASTM D-698 (Standard Proctor). Additional Horizon C, Horizon B where designated, and 6 inches of topsoil (Horizon A) were placed to complete the cover soil build up. Analytical sample results of Horizon A are also included in the Backfill Sample Comparison to NJDEP Standards table in **Appendix L**. The approximate volumes of cap cover soils imported and placed above the cap components were as follows:

| Material Layer | Vendor/Source | Approximate Volume Imported (CYs) |
|---|---|---|
| GDL Cover Soil | Celgene | 15,200 |
| Structural Fill under Roadways | Liberty | 5,000 |
| Structural Fill under Roadways | Tilcon Mount Hope | 7,000 |

| Material Layer | Vendor/Source | Approximate Volume Imported (CYs) |
|---|---|---|
| Horizon A - Topsoil | Nature's Choice | 9,500 |
| Horizon A - Topsoil | Excavating Materials & Equipment, Inc. (EME) | 150 |
| Horizon B | Cedar Hill | 11,600 |
| Horizon C | Nature's Choice | 11,600 |

In accordance with the SA-6 South Consent Decree, a minimum thickness of 1 foot of clean soil (in areas to be paved) and 2 feet of clean soils (in other unpaved areas) were placed above the geomembrane liner. More clean soils may have actually been placed depending on the final surface grade features. The SA-6 South Consent Decree required an average thickness of clean cover soil above the geomembrane of 3 feet. The actual average thickness is 4.4 feet.

Throughout the work, the amount of cover soil varied. As work advanced in some places the GDL was exposed for more than 30 days. Subsequently, GDL repairs were completed in April 2016 at the locations shown on the figure on Record Drawing SA6 South Cap Panel Layout, 60-mil Textured LLDPE Geomembrane 01/28/16 (**Appendix C**).

The cap was designed with consideration of grading, drainage, and groundwater management provisions of the adjacent SA-7 site.

The methane vents extend from the geocomposite drainage, gas collection layer below the geomembrane liner through the cover soils to the atmosphere. See the Gas Vent Detail figure in **Appendix C** for details of construction.

# 11.0 PERIMETER AIR MONITORING

As part of the Health and Safety monitoring conducted during remediation, air monitoring within the work zone area and around the perimeter of SA-6 South was implemented by Emilcott Associates, Inc., on behalf of Honeywell, to assess in an ongoing manner that COCs did not result in potential exposures to the surrounding public. Honeywell maintains a website at the following URL: www.jerseycitychromiumcleanup.com, which provided daily updates with perimeter air data and other information during implementation of the SA-6 Chromium Remedy. Any changes to the website or URL will be addressed as part of Long Term Monitoring activities pursuant to the LTMP. **Tables 1A and 1B** contain the baseline and project data.

The primary COC, potentially found in dust from activities occurring at the site, was hexavalent chromium. Action levels determined for the SA-6 South project included 339.0 micrograms per cubic meter (µg/m$^3$) for air-borne dust. Although the approved action level for SA-6 South is 339 µg/m$^3$, Honeywell voluntarily applied the action level of 221 µg/m$^3$ that was calculated for SA-6 North, since the remedies for SA-6 North and SA-6 South were implemented as an integrated remedy. The discrepancy in air monitoring levels between the two sites, was not attributable to chromium, but was rather based on the presence of lead as a contaminant in discrete areas of SA-6 North. Thus, the air monitoring level was based on the potential for encountering lead dust at that site. Preventative measures taken to control the generation of dust were conducted per the PAMP and HASPs. In order to assess the potential presence of hexavalent chromium in dust, the perimeter air monitoring stations were located throughout the multi-phase excavation activities using a grid system as shown on **Figure 4**. The points were determined by the PAMP and the Honeywell onsite representative based on the location of soil disturbance activities, prevailing wind direction, and field conditions.

Baseline PAMP data was discussed and presented in Section 2.3. In the course of the project, there were no recorded employee exposures above the OSHA Permissible Exposure Limit. The highest total particulate detection at SA-6 South was on March 8, 2016 at 200 µg/m$^3$ (below operative action level of 221 µg/m$^3$) where the corresponding hexavalent chromium sample was not detected. The highest

hexavalent chromium detection was on November 25, 2013 at 42 nanograms per cubic meter where the corresponding particulate detection was 77 µg/m$^3$.

# 12.0 IN-SITU TREATMENT

Pursuant to the SA-6 South 100% Design Report, in-situ injections of a chemical reductant were conducted within the Site 163 Development AOC to treat chromium-impacted soils at depths greater than 4 feet bgs in isolated locations. The in-situ injections were ineffective. As a result, the chromium-impacted soils that were not effectively treated within the Site 163 Development AOC Non-Deed Notice Area were excavated. In the Site 163 Development AOC Deed Notice Area chromium-impacted soils that were not effectively treated were left in place and capped with clean soil and gravel. The in-situ work is described below.

In-situ treatment was conducted per the Work Plan which was submitted to the NJDEP as part of the Discharge to Groundwater Permit-By-Rule (DGW-PBR) and provided additional details regarding the in-situ treatment program. This Work Plan was submitted to the NJDEP on September 28, 2012 and NJDEP issued the DGW-PBR on January 3, 2013.

In accordance with the SRIR/RASR/RAWP and subsequent work plans, the in-situ injections of calcium polysulfide (CAPS) spanned a zone from 2 feet above to 2 feet below the impacted zone. Further, injections were not implemented below the Stratum D underlying the hexavalent-impacted soil/fill materials.

Prior to the initiation of injections in each area, 57 temporary well points (TWPs) were installed. TWPs were installed from July 21, 2014 and from July 28, 2014 through July 31, 2014.

Geoprobe® direct push drill rigs were used to accomplish injection of CAPS solution. Injections were initiated on July 31, 2014 using one drill rig and one mixing station. On August 4, 2014, a second Geoprobe® direct push drill rig was mobilized to Site 163 to inject CAPS solution simultaneously utilizing two mixing stations. In several areas, surficial concrete slabs or unknown subsurface obstructions required minor field adjustments to the originally proposed TWP or injection point locations.

Following the in-situ treatment program, 6-month soil sampling was implemented as described in the Site 163 Cr RIR/RASR/RAWP to determine the effectiveness of the in-situ treatment. The results are included in **Table 8** and showed that the 20

mg/kg criterion had not been uniformly achieved in the area of treatment. It was determined that additional excavation would be required to remediate the chromium soils to <20 mg/kg as shown in **Figure 18**.

Major DC 2015-09-28 described that an additional 6,335 square feet of soil would be excavated from the Site 163 Development AOC Non-Deed Notice Area and the area backfilled with clean fill. DC 2015-09-28 also provided that unexcavated areas in the Site 163 Development AOC Deed Notice Area, south of the proposed curb line that will be part of the Riverside Park, Riverside Drive, and Kellogg Street, will be deed restricted and subject to a conservation restriction, consistent with paragraph 61(c)(ii)(3) of the Study Area 6 South Consent Decree.

# 13.0 GWTP RELOCATION AND CONSTRUCTION

Honeywell constructed a new GWTP on SA-6 North. The GWTP is designed to handle and treat groundwater recovered as part of the SA-7 deep overburden and bedrock groundwater remedy and will handle and treat shallow groundwater from the activation of the contingent groundwater extraction system installed within the Open Space AOC. The former GWTP previously located at Site 140 on SA-6 South in the former ABR Trucking warehouse and office building was demolished to implement the SA-6 South Chromium Remedy. The former GWTP was initially built to handle and treat construction water during the SA-7 chromium remedy, but following the completion of the remediation of SA-7, had been treating recovered regional deep and overburden groundwater since December 2008. Once the new GWTP was built and started accepting flows on February 14, 2014, the former GWTP at SA-6 South was decommissioned, dismantled and removed from the Site 140 building.

AMEC Foster Wheeler designed, permitted and managed the construction of the 65 gpm GWTP beginning in March 2013. The GWTP pre-treats hexavalent chromium contaminated groundwater for discharge to the PVSC. The GWTP replaced an existing plant at 80 Kellogg Street which needed to be demolished as required for soil remediation activities. The $4.5M GWTP design/build project also involved re-configuration of the existing three well groundwater extraction system, controls, and double wall conveyance system to allow for transition of flow from the old plant to the new plant and as required for GWTP commissioning activities.

The new GWTP incorporates chemical reduction, precipitation, flocculation, clarification and filter press processes which generates significantly less filter cake than the microfiltration system used in the original plant. The GWTP is housed in a 4,800-square foot pre-engineered metal building which also accommodates an office, equipment repair shop and state of the art chemical storage rooms and tanker offloading facilities.

Such facilities incorporate secondary containment, automatic leak and vapor detection systems, and an interface control system with remote monitoring capability, a closed-circuit television monitoring system as well as a card swipe access control and burglar alarm system. An innovative hydraulic pusher system

was also custom designed and installed to allow for more efficient filling of the 30 CY waste filter cake roll-off. Local permitting included development of site plan approval applications and testimony as required for both existing conditions and post redevelopment conditions. Interaction with the Jersey City building department and JCMUA at the preliminary design phase also led to a more streamlined building permitting process and local cooperation during the construction phase.

# 14.0 SITE RESTORATION

Site restoration activities were performed during the demobilization phase of the project. Site restoration activities included the following:

- Decontamination and demobilization of construction equipment and surplus materials;
- Decontamination, decommissioning and dismantling of the construction wastewater treatment system piping;
- Relocation/removal of the jersey barriers and relocation of the chain-link fence along the Route 440 sidewalk to the property line boundary;
- Removal of contractor temporary office trailers and power/phone service;
- Removal of traffic control features along Route 440;
- Removal of construction debris;
- Disposal of other non-regulated waste; and
- Stabilization of the Open Space AOC cover soils, including seeding and other erosion control measures.

# 15.0 CONSTRUCTION PERMITS

The following construction permits were obtained to complete the onsite work. Applications for renewals were submitted as needed. Permits that were no longer required were allowed to expire.

| Permit | Site | Status | Expiration Date |
|---|---|---|---|
| NJDEP CAFRA/FHA | SA-6 South Only | Obtained 9/26/2012 | 9/25/2017 |
| PVSC SUP No. 31630019 | SA-6 Chromium Remedy | Obtained 3/26/2014 Final Revision 5/23/14 | 8/31/2018 |
| Soil Erosion and Sedimentation Control Plan | SA-6 Chromium Remedy | Obtained 5/16/2013 | 11/16/2016 |
| Request for Authorization (RFA) | SA-6 Chromium Remedy | Obtained 5/29/2013 | Not Specified |
| NJDEP - Water Allocation | SA-6 Chromium Remedy | Obtained 6/19/2013 | 5/31/2018 |
| NJDEP – Treatment Works Approval (TWA) | SA-6 Chromium Remedy | Obtained 7/8/2013 | 6/30/2016 (no extension necessary) |
| NJDOT - Highway Occupancy Permit | SA-6 Chromium Remedy | Obtained 9/11/2013 Extension Obtained 10/14/2015 | 6/30/2016 |
| NJDEP Discharge to Groundwater (DGW) for In-Situ Treatment of Chromium Impacted Soils | SA-6 South (Site 163) Only | Obtained 1/3/2013 | Not Specified |

| Permit | Site | Status | Expiration Date |
|---|---|---|---|
| NJDOT – Application for Drainage Connection, Post Remediation Grading and Drainage | SA-6 Chromium Remedy | Application Submitted 8/19/14 Permit Application Rescinded 12/1/14 & Approved by DOT on 12/18/14 | N/A |
| NJDOT – Highway Occupancy Permit – Installation of Sheet Piling and Excavation Adjacent to Rte. 440 ROW | SA-6 Chromium Remedy | Final Executed Permit Issued 12/2/14 Extension Obtained 12/24/2015 | 12/3/2016 |

# 16.0 SUSTAINABILITY EFFORTS DURING CONSTRUCTION

Under Honeywell's stewardship the construction process was integrated into the overall vision for the Jersey City west side redevelopment by incorporating a sustainable design approach which focused on conservation of natural resources through beneficial reuse, recycling, minimization of ongoing energy consumption and reduction in carbon footprint. Specifically, Honeywell's sustainable construction efforts integrated:

- Use of renewable B-20 Biodiesel in lieu of conventional fossil fuel based petro-diesel in construction equipment,
- Crushing and recycling of demolition generated clean concrete to be reused as clean fill material on site, and
- The removal and transportation of petroleum soils from the SA-6 South cap to reduce Greenhouse Gas emissions via hazardous waste reduction.

# 17.0 POST-REMEDY OPERATION & MAINTENANCE

Following completion of the remedial actions, including installation of the groundwater extraction system which is to be operated on a contingent basis, a post-remediation long term monitoring program will be implemented in accordance with the pending LTMP. The LTMP was developed and submitted to NJDEP and all Parties in October 2015 to address the monitoring requirements specified in the SA-6 South Consent Decree Paragraphs 74 and 78. As of the writing of this CCR, Honeywell and the Parties are in final negotiations regarding the terms of the LTMP. Honeywell will be implementing the uncontested LTMP activities until the LTMP is finalized. The LTMP satisfies the Consent Decree requirements for long term monitoring, maintenance, and protection of engineering and institutional controls by establishing procedures and schedules for the following activities required by the Consent Decree:

- Quarterly visual inspections to ensure only permitted land usage is occurring and verify no usage compromises the integrity of the Chromium Remedy;
- Quarterly visual inspection monitoring of the grade and slope to identify whether erosion has occurred or is occurring;
- Quarterly visual inspection monitoring to determine if noticeable differential settlement or subsidence has occurred that could impair the integrity of the Chromium Remedy;
- Baseline topographic survey at completion of the Chromium Remedy and additional surveys annually for the first 5 years, then every 5 years for an additional 10 years;
- Quarterly visual inspection monitoring to determine if disturbance of the Chromium Remedy in the Open Space AOC has occurred;
- Quarterly visual inspection monitoring to ensure that burrowing animals are not materially impairing the integrity of the Chromium Remedy;
- Quarterly visual inspection monitoring of the vegetative cover to ensure that vegetative cover in the Open Space AOC is in conformance with the landscaping provisions of the SA-6 South 100% Design, including the OSDS, and the Redevelopment Plan and will not materially impair the integrity of the Chromium Remedy;

- Maintenance of the vegetative cover to include mowing to ensure tree species cannot become established except in designated areas and removal of any vegetation not permitted by the OSDS that would impair the integrity of the Chromium Remedy;
- Quarterly groundwater elevation monitoring to ensure specified hydraulic gradients across the hydraulic barriers;
- Monthly monitoring of vented gases and the gas venting system for 1 year. Frequency will be reduced to quarterly after 1 year if data are stable; and
- Any additional monitoring required by the specific design details.

The draft LTMP was submitted to all Parties, including NJDEP, in October 2015. A revised draft LTMP was submitted to all Parties, including NJDEP, in September 2016. The LTMP, once finalized after review by the NJDEP, Plaintiffs and the Special Master, will be the governing document for the operation, maintenance, and inspection of the Chromium Remedy components, including the contingent operation of the groundwater extraction system.

The relationship between long-term monitoring and institutional controls that are required by the SA-6 South Chromium Remedy is discussed in Section 18.

# 18.0 INSTITUTIONAL CONTROLS

Institutional controls are integral to the Chromium Remedy at SA-6 South and were made a part of the RAOs. The institutional controls are applied in accordance with Subchapter 7 of NJDEP's ARRCS (N.J.A.C. 7:26C).

Institutional controls include deed notices and remedial action permits at specific areas where chromium-impacted soils remain and a groundwater remedial action permit and CEA for residual chromium-impacted groundwater. Additional institutional controls for the Open Space AOC and a portion of Site 163 pursuant to the SA-6 South consent decrees include transferring ownership to Jersey City and the granting of a conservation restriction.

## 18.1 DEED NOTICES

To meet Honeywell's and Bayfront's objectives for SA-6 South and coordinate with the objectives of the Development, four deed notices are required for the chromium impacts at SA-6 South. The areas to which each of the four deed notices apply are shown on **Figure 19**. Draft deed notices are contained in **Appendix R**. After the final text of the deed notices has been reviewed and approved by the NJDEP, they will be recorded at the office of the Hudson County Register.

The deed notices have been prepared in accordance with NJDEP's ARRCS. Each deed notice specifies conditions for alteration, improvement, and/or disturbance of the engineering controls, and provides monitoring, maintenance, notification and reporting requirements. These requirements include documentation that applicable worker health and safety laws and regulations are followed during the disturbance and restoration of those controls. The deed notices contain figures and cross-sections showing the engineering controls and details regarding notification and reporting requirements.

## 18.2 SOIL REMEDIAL ACTION PERMITS

Honeywell has prepared draft Remedial Action Permit Applications for Soil for the SA-6 South Open Space AOC, the deed noticed portion of Site 163, and the two Deferred Areas for NJDEP review. Once the deed notices are filed, the Remedial Action Permit applications will be finalized and submitted to the NJDEP. The permit applications contain requirements for monitoring, maintenance and

reporting to document the protectiveness of the remedial actions and engineering controls for each of the areas on which the deed notices have been established until such time the deed notice is no longer required. The permit also includes a schedule for submittal of Biennial Certification Reports to the NJDEP, and requirements pertaining to financial assurance (see Section 20) and permit transfer, modification and termination.

## 18.3 GROUNDWATER REMEDIAL ACTION PERMITS

Honeywell has prepared a draft Remedial Action Permit Application for Groundwater for the SA-6 South Open Space AOC. The draft Remedial Action Permit application was attached to the RAR approved by NJDEP on March 30, 2017, and now that the RAR has been approved by NJDEP, the Remedial Action Permit application will be finalized and submitted to the NJDEP. The permit applications contain requirements for monitoring, maintenance and reporting to document the protectiveness of the remedial actions and engineering controls for each of the areas on which the deed notices have been established until such time the deed notice is no longer required. The permit also includes a schedule for submittal of Biennial Certification Reports to the NJDEP, and requirements pertaining to financial assurance (see Section 20) and permit transfer, modification and termination.

## 18.4 CLASSIFICATION EXCEPTION AREA

A regional CEA for groundwater has been established by NJDEP on February 16, 2012 for the SA-5/6/7 sites as an institutional control to identify chromium-impacted groundwater above the NJDEP GWQS and prevent the use of groundwater within the designated CEA areas. The CEAs address the shallow fill, deep overburden, and bedrock zones. The shallow zone refers to groundwater within fill material (above the Stratum D and underlying native soils), generally to a depth of 20 feet bgs. The deep overburden zone refers to groundwater below the fill and Stratum D down to bedrock, generally from approximately 20 feet to 90 feet bgs. The bedrock zone refers to groundwater within the upper 20 to 40 feet of fractured bedrock. The shallow groundwater CEA may be modified in the future following one year of post-remedial action groundwater monitoring.

## 18.5 CONSERVATION RESTRICTIONS

Conservation Restrictions were prepared for both Open Space Areas at SA-6 North and SA-6 South at the time of property transfer from Jersey City Redevelopment

Agency to Bayfront Redevelopment LLC per Paragraph 60(b) of the SA-6 North Consent Decree and at the time of the granting of the option to buy per Paragraph 74(b) of the SA-6 South Consent Decree. These conservation restrictions were recorded on March 25, 2010. The existing conservation restriction placed on the SA-6 South Open Space AOC will be amended to include the as-built hydraulic barrier walls. A new conservation restriction will be established on the deed noticed portion of Site 163, where remaining chromium-impacted soils were identified in the area south of the northern curbline which is within the Development AOC, or Honeywell may combine this area with the conservation restriction for the SA-6 South Open Space AOC. Hackensack River Watershed Land Trust shall be the primary holder of the conservation restrictions.

# 19.0 RECORD DRAWINGS

In accordance with Section 60(j)(viii) of the SA-6 South Consent Decree and the TRSR, Record Drawings were prepared and are included in **Appendix C**. Maser completed surveys by a NJ licensed surveyor and Mr. Thomas Hugg sealed drawings prepared by Maser. Amec Foster Wheeler engineer of record for SA-6 South, Mr. Samuel (Geoff) Shallard, PE, sealed Record Drawings prepared by Amec Foster Wheeler.

The Record Drawings and the SA-6 South 100% Design Report set the standard for future repair or replacement of the Chromium Remedy under the Study Area 6 South Consent Decree.

# 20.0 REMEDIAL ACTION COSTS

Remediation costs are summarized in the table below:

| Activity | Cost ($1MM) |
|---|---|
| Construction Costs | $28 |
| Soil Disposal | $8 |
| Oversight/Construction Management | $1.6 |
| **Total** | **$37.6** |

## 20.1 FINANCIAL ASSURANCES

Long term monitoring for SA 6 North and South is part of the overall financial assurance letter of credit for chromium remediation at SA-5, SA-6 North, SA-6 South, and SA-7 that are subject to the oversight of the Special Master. This letter of credit is issued by the MUFG Union Bank, N.A. in the amount of $46,915,000 to cover all remediation and long term monitoring activities at these sites.

# 21.0 REMEDIATION CLOSE OUT SUMMARY

The Chromium Remedy at SA-6 South commenced on March 2013 and was substantially complete by November 2016. The Chromium Remedy was implemented in accordance with the TRSR, the ACO, the SA-6 South Consent Decree, the SA-6 South 100% Design Report and subsequent DCs, and other clarifying correspondence between Honeywell and NJDEP and/or Honeywell, the Special Master, and Plaintiffs. Therefore, other than remediation of the Deferred Areas, no further remedial actions are required for either the Development or Open Space AOCs at SA-6 South. Remediation of Deferred Areas will be coordinated with the Bayfront Redevelopment Project and the widening of Route 440.

The RAOs for SA-6 South soils, except in the Deferred Areas, will be met by the Chromium Remedy implemented in all AOCs and the establishment of institutional controls. It is anticipated that RAOs for SA-6 South shallow groundwater in the Development AOCs will be met as a result of the removal of chromium-impacted soil from the Development Area AOC and containment and capping of chromium-impacted soils and groundwater in the Open Space AOC, but will be confirmed by post-remediation shallow groundwater sampling. The hydraulic barrier is designed to restrict potential offsite migration of chromium-impacted groundwater. Post-remediation groundwater sampling will be implemented in the Development AOCs in accordance with the LTMP prepared for both SA-6 North and SA-6 South. The LTMP establishes procedures and schedules for long-term monitoring of groundwater quality and levels in the Open Space AOC to determine the potential operation of the contingent groundwater extraction system. The LTMP also establishes the inspection, maintenance, and operation of critical features of the Chromium Remedy.

Honeywell will establish appropriate institutional controls at SA-6 South that supplement the physical remedial actions including deed notices and remedial action permits for soils for four distinct areas, conservation restrictions for the Open Space AOC and the deed noticed portion of Site 163, and a groundwater remedial action permit in the Open Space AOC. A classification exception area has already been established with NJDEP for the regional shallow groundwater, but Honeywell may revise the boundary of the shallow groundwater CEA slightly based upon the post-

remediation shallow groundwater results at SA-6 South. Final soil and groundwater Remedial Action Permit applications will be submitted to NJDEP.

It is Honeywell's intention that this CCR will close out remediation of chromium-impacted soil for SA-6 South with the exception of the Deferred Areas. Honeywell will document additional soil remediation in the deferred areas by filing supplements to this CCR. NJDEP has reviewed and approved the RAR submitted separately from this CCR. Honeywell will close out remediation of chromium-impacted shallow groundwater in the Development AOCs once groundwater sampling confirms that the RAOs have been met. Honeywell will document the completed remediation of the shallow groundwater in the Development AOCs by filing a supplement to this CCR.

In accordance with paragraph 5 of the Consent Order Entering Consolidated 100% Design for Study Area 6 North and Study Area 6 South, *Jersey City Municipal Utilities Auth. v. Honeywell,* No. 2:05-cv-05955-DMC-JAD (D. N.J. July 9, 2013), ECF No. 448, Honeywell will submit a Consent Order which has appended to it (i) the 100% Design except the drawings and (ii) the Final CCR for entry into Federal Court. The supplements to this CCR for the deferred areas and shallow groundwater will be subject to the Special Master review and approval requirements of the SA-6 South Consent Decree, and will be filed with the Court as a supplement to the Consent Order filed in accordance with paragraph 5 of the Consent Order Entering Consolidated 100% Design for Study Area 6 North and Study Area 6 South.

Notes:

1. New Jersey State Plane Coordinates relative to North American Datum (NAD) of 1983.
2. Diam (in) = Well diameter in inches
3. PVC = Polyvinyl Chloride
4. SS = Stainless Steel
5. SA-7 wells included are within the SA-6 South Open Space AOC.
6. Well depth is feet below top of casing (April 2016).
7. NM = not measured.

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7:26D; last amended 5/7/2012].

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last amended November 2013]

NC: No criterion established

**Bold and shaded concentrations exceed the NJ 2012 MOST STRINGENT SRS**

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

Prepared by: DP 05/24/2016
Reviewed by: JLD 05/24/2016

Notes:
NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7:26D; last amended 5/7/2012].
NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last amended November 2013]
NC: No criterion established
**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**
**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**
*Italicized values not detected; reporting limit exceeds criteria*
Depths reported in feet below ground surface
J: Estimated concentration
R or N: Rejected or negated by laboratory or data validator
U: Not detected above method detection limit
Results with a value of "0" indicates no TICs were detected

Notes:
NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standar
NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.
NC: No criterion established
**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**
**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**
*Italicized values not detected; reporting limit exceeds criteria*
Depths reported in feet below ground surface
J: Estimated concentration
R or N: Rejected or negated by laboratory or data validator
U: Not detected above method detection limit
Results with a value of "0" indicates no TICs were detected

Prepared by: DP 02/15/2016

Notes:
NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standar
NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.
NC: No criterion established
**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**
**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**
*Italicized values not detected; reporting limit exceeds criteria*
Depths reported in feet below ground surface
J: Estimated concentration
R or N: Rejected or negated by laboratory or data validator
U: Not detected above method detection limit
Results with a value of "0" indicates no TICs were detected

Prepared by: DP 02/15/2016

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standar

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

J: Estimated concentration

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Prepared by: DP 02/15/2016

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7:26D; last amended 5/7/2012].

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last amended November 2013]

NC: No criterion established

**STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

B: Analyte found in sample and associated blank

J: Estimated concentration

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standard

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C

NC: No criterion established

**STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

B: Analyte found in sample and associated blank

J: Estimated concentration

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Prepared by: DP 02/15/2016

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standard

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C

NC: No criterion established

**STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

B: Analyte found in sample and associated blank

J: Estimated concentration

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediati

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Lev

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

J: Estimated concentration

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediati

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Lev

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

J: Estimated concentration

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

116 SA-6S grouting angles

# SA-6 South Chromium Remedy

117 Contingent groundwater trench

118 Contingent GW system

119 Setting HB sheets to grade

120 SA-6S grouting angles

# SA-6 South Chromium Remedy

121 SA-6S temp sheet driving

122 Vibration Monitoring Equipment

123 1S Pre-surcharge

124 Covering holes in SCB wall with bentonite

# SA-6 South Chromium Remedy

125 Surcharge Placement

126 SA-6S HB installation

127 SA-6S HB installation

128 Off-loading material on surcharge S1

# SA-6 South Chromium Remedy

129 Welded angle repair-full section

130 Pushing out cover soil at station 18+00

131 Laying out Do Not Dig tape in the B Street corridor

132 Installing sheets to grade

133 Pushing cover soil over the edge of the eastern slope of the B Street corridor

134 Sheetpile installation

135 Installed sheetpiles with swellseal

136 Entact reached the current end of the GDL with the cover soil

137 Surveying gravel in contingent groundwater trench

138 Placing soil on top of gravel in contingent groundwater trench

139 2S surcharge pile

140 Placing material over fabric on 2S surcharge pile

141 Pipe contected to manhole in trench

142 Manhole, stone, and geo-tech fabric in trench

143 S1 surcharge pile

144 End dump unloading material over demarcation fabric in S1 surcharge area

145 Demarcation fabric with material being placed over it on S1 surcharge area

146 S1 surcharge pile dozer placing material in 1 foot lifts

147 Placement of demarcation fabric on S1 surcharge

148 Special closure section for SA-6 South HB wall

# SA-6 South Chromium Remedy

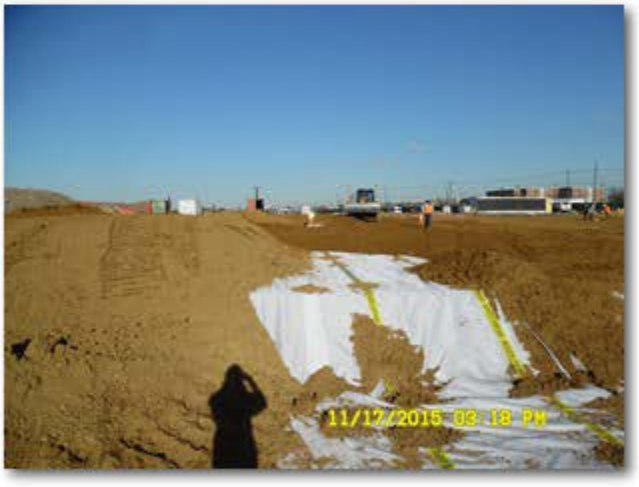
149 2S surcharge pile

150 Special closure section for SA-6 HB wall in place

151 Pushing cover soil through the C Street corridor

152 Cover soil progress along the SCB wall

# SA-6 South Chromium Remedy



153 Caution tape placed over root barrier

154 Geofoam installation in corridor

155 Graded cover soil

156 Placement of Horizon C soil

# SA-6 South Chromium Remedy

157 Graded cover soil in utility corridor

158 Root barrier with caution tape

159 Site 163 in-situ treatment containment area

160 Site 163 in-situ treatment markout

# SA-6 South Chromium Remedy

161 Site 163 in-situ active treatment

162 Site 163 in-situ active treatment

163 Fine grading the cap subgrade near sta. 18+00

164 Removing surcharge soil from the SA-6 south cap area

165 Fine grading and compacting the cap subgrade at sta. 15+50

166 Placing historic fill outboard of the HB Wall

167 Beginning to sculpt the cap subgrade in the southwest corner of 3S

168 Placing historic fill from 1N outboard of the HB wall in cells 115-105

169 East corner of cap

170 Fine grading and compacting the cap subgrade at Sta. 24+00

171 Fine grading on 1S

172 Fine grading the cap subgrade at Sta. 23+50

# SA-6 South Chromium Remedy

173 South side of cap

174 Hand grading SA-6 cap area

175 Graded surcharge material stockpiled on SA-7

176 Inspecting cover of SA-6 S cap area

# SA-6 South Chromium Remedy

177 Liner installation in south cap

178 Beginning to spread cover soil at station 23+00

179 Grading Eastern cap material

180 Spreading coversoil over south cap

# SA-6 South Chromium Remedy

181 Grading Eastern cap material

182 Spreading coversoil over south cap

183 Enddump placing coversoil onto south cap

184 Grading cap material

# SA-6 South Chromium Remedy

185 Grading Eastern cap material

186 Loading cap material

187 South cap demarcation layer

188 Plastic covered cap area

189 Screening surcharge soil directly into dump trucks for transport to the west side of the cap

190 South cap demarcation layer

191 Grading cap material

192 Spreading coversoil over south cap

193 ESI laying down GDL and demarcation layer on the south cap and P-122

194 Eastern edge of the south cap

195 Placing geomembrane layer on the eastern boundary of the south cap

196 Excavating the asphalt out of the SA-6S cap area at station 2+00

# SA-6 South Chromium Remedy

197 Installing liner on south cap near the eastern boundary

198 Placing geomembrane layer on the eastern boundary of the south cap

199 Placing soil onto the south side of the SA-6S cap near station 11+00

200 Placing geomembrane layer on the eastern boundary of the south cap

# SA-6 South Chromium Remedy

201 Geotextile fabric to cover stratum O from cells 24-29

202 Spreading coversoil on south cap

203 Screening Celgene soil into a truck to be transfered to the SA-6S cap

204 Spreading coversoil on south cap

# SA-6 South Chromium Remedy

205 Coversoil and warning tape progress along the south slope of the cap near station 9+00

206 Grading cap material

207 Regrading cap material

208 Regrading cap material

# SA-6 South Chromium Remedy

209 Creating ramp onto SA-6 S cap for coversoil

210 Grading cap material

211 Connecting GDL panels 1 and 2

212 Cementing SCB top on the north end of the east side of the south cap

# SA-6 South Chromium Remedy

213 Rolling out the first panel of GDL

214 3S cap area

215 3S cap area

## GENERAL NOTES

1. *THE SOLE PURPOSE OF THIS PLAN IS TO SHOW AS-BUILT GEOMEMBRANE GRADING ELEVATIONS WITHIN THE SA6 SOUTH CAP AREA AT THE PROJECT SITE.*
2. *AS-BUILT GEOMEMBRANE GRADING LOCATIONS AND ELEVATIONS WERE OBTAINED BY MASER CONSULTING P.A. ON MULTIPLE FIELD VISITS FROM 7/2/15 THROUGH 10/7/15. GEOMEMBRANE GRADING SURFACES AND CONTOURS WERE GENERATED BY ENTACT, CHECKED BY AMEC AND CONFIRMED BY MASER CONSULTING P.A.*
3. *HORIZONTAL DATUM NAD 1983, VERTICAL DATUM NGVD29.*

Notes: Maximum Dry Density for Celgene GDL Cover Soil (CS) based on Vertical 5 Northeast Inc Sample ID 12691 approved in Entact Submittal 112B
Maximum Dry Density for 6 inch lift of Horizon C based on Vertical 5 Northeast Inc Sample ID 12934
Maximum Dry Density for Liberty Structural Fill (SF) based on Vertical 5 Northeast Inc Sample ID 12924 approved in Entact Submittal 117A
Maximum Dry Density for Tilcon Structural Fill (SF) based on Vertical 5 Northeast Inc Sample ID 13163 approved in Entact Submittal 128
Sample ID CS-1-2 Where:
CS=Cover Soil; HC=Horizon C; SF=Structural Fill
1 = Test Location as noted on Compaction Location Figures
2 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again

HC-107 became a Structural Fill test location after the D Street Corridor was widened

***Notes:*** Maximum Dry Density (gravel corrected) for Weldon WC QP based on Sor Testing Laboratories Report No. 13-2027 dated 12/9/13. Sample collected from on site soils.
Maximum Dry Density for Weldon WC Screenings based on Sor Testing Laboratories Report No. 13-1877 dated 11/6/13.
Maximum Dry Density (gravel corrected) for Tilcon MH DGA based on Sor Testing Laboratories Report No. 13-1334 dated 8/7/13.
Maximum Dry Density for Weldon LH Screenings based on Vertical V Laboratory Report No. 12643 dated 9/29/14.
Re-used on site historical fill material (Type A) will not be tested for compaction per Specification Section 02315-3.13 A.2.b
Moisture content not to exceed 3% above optimum per Specification Section 02315-2.04C
Bottom of excavation elevation based on Maser survey data (Center Point elevations)
Sample ID BF-01-01 where:

BF = Backfill (At frequency of 1 test/2500 SF)
01 = Test Location (as noted on Backfill Compaction Location Figure)
01 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again
= Area subject to re-compaction

* *Initial field testing indicated compaction of greater then 95% (see attached Sor Testing Lab (STL) memo). Laboratory results for initially provided Weldon WC QP sample indicated a maximum dry density of 136.7 pcf. Using this density the compaction results are greater than the 95%. Laboratory tests on later deliveries indicated density results of 142.6 pcf. This range is typical of what can be expected for this type of source. The Engineer of Record (EOR) directed that the results be reported using the higher more conservative value and that the STL field test report verifying the higher passing results be attached to the final documentation. It is further noted that the Design Documents do not designate this area for compaction as Structural Fill per Specification Section 02315 Section 3.12, Structural Fill 95%; Non Structural Fill 90% Standard Proctor. The 95% value noted in this Table was implemented to provide for uniform compaction in areas slated for future development. It is the EOR's opinion that these two samples meet the 100% Design and project requirements.*

| Client: | Entact Environmental Services | | |
| Project: | Honeywell SA-6, Jersey City NJ | | |
| Subject: | In-Place Density Tests | | |
| Job No.: | 13-208 | Report No.: 13-1994 | Date: 12/3/13 |

At the request of the client, on November 22, 2013 a field technician from Sor Testing Laboratories, Inc. reported to the project site for the purpose of performing in-place density tests over previously compacted lifts of materials at locations indicated by the client's representative.

Using a nuclear density gauge, our technician performed two density tests at locations 01BF-2 and 02BF-2 per the client's instructions. The proctor value of 136.7 pcf at our optimum moisture content of 8.1% was also provided by the client.

Test results were 97.5% and 95.7% compaction.

Technician: J.C. Jean-Toussaint

Very truly yours,

***Notes:*** Maximum Dry Density for Weldon WC Screenings based on Sor Testing Laboratories Report No. 13-1877 dated 11/6/13.
Maximum Dry Density (gravel corrected) for Tilcon MH DGA based on Sor Testing Laboratories Report No. 13-1334 dated 8/7/13.
Re-used on site historical fill material (Type A) will not be tested for compaction per Specification Section 02315-3.13 A.2.b
Moisture content not to exceed 3% above optimum per Specification Section 02315-2.04C
Bottom of excavation elevation based on Maser survey data (Center Point elevations)
Sample ID RF-01-01 where:

RF = Reduced Frequency
01 = Test Location (as noted on Backfill Compaction Location Figure)
01 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again
= Area subject to re-compaction

143-SB-43R: "R" designation indicates Reference Confirmatory Point for a designated Bottom Excavation Area. Coordinates come from Center Points within that specific cell.

1 This is the actual elevation of the PDI Bottom sample included in the 100% design.

143-SB-43R: "R" designation indicates Reference Confirmatory Point for a designated Bottom Excavation Area. Coordinates come from Center Points within that specific cell.

1 This is the actual elevation of the PDI Bottom sample included in the 100% design.

3 Horizontal and/or vertical expansion of excavation due to visual inspection and analytical sampling resulted in removal of the PDI Sidewall Sample. The objectives of the 100% design and the target excavation limits were achieved.

4 Additional sidewall sample collected and analyzed to establish expanded excavation limit.

**Maser Consulting P.A. certifies that the elevations, with their corresponding date obtained, of the Confirmatory Points depicted in Table 1, Center Points in Table 2, Sidewall Confirmatory Sidewall Points Table 3 and Bottom of Excavation topographic spot elevations are correct, and representative of the as-built post-excavation grades throughout the corresponding excavation cells.**

## SA-6 South: Site 163 Chrome Excavation (2016): Confirmatory Points (Table 1.0)

| Bottom Target Coordinates (based on PDI) | | | | As-built Elevations | | |
|---|---|---|---|---|---|---|
| Northing | Easting | Elevation 1 | Sample ID | Date Obtained | Elevation | Comments |
| 685069.7 | 601654.2 | -3.0 | 163-SB-011 | 1/15/2016 | -3.2 | Target Elevation Reached |
| 685102.9 | 601588.4 | -6.7 | 163-SB-015 | 1/19/2016 | -6.8 | Target Elevation Reached |
| 685184.5 | 601554.4 | -6.7 | 163-SB-104 | 2/12/2016 | -7.1 | Target Elevation Reached |
| 685186.5 | 601509.2 | -8.0 | 163-SB-016 | 2/19/2016 | -8.3 | Target Elevation Reached 2 |
| 685247.3 | 601467.8 | -6.6 | 163-SB-105 | 2/19/2016 | -7.1 | Target Elevation Reached* |

* The PDI Target Depth was -6.6 ft. The excavation Design Bottom was set conservatively at -6.8 ft. The excavation bottom was surveyed at -7.1 ft.

## SA-6 South: Site 163 Chrome Excavation (2016): Sidewall Confirmatory Points (Table 2.0)

| Sidewall Target Coordinates | | | | As-built Elevations | | |
|---|---|---|---|---|---|---|
| Northing | Easting | Elevation 1 | Sample ID | Date Obtained | Elevation | Comments |
| 685138.0 | 601563.6 | -5.3 | 163-SB-078 | 1/19/2016 | -6.9 | Target Elevation Reached |
| 685165.5 | 601546.0 | -3.5 | 163-SB-080 | 2/12/2016 | -7.1 | Target Elevation Reached |
| 685201.0 | 601525.8 | -5.0 | 163-SB-019 | 2/19/2016 | -7.1 | Target Elevation Reached |
| 685207.2 | 601503.5 | -3.0 | 163-SB-037 | 2/19/2016 | -7.1 | Target Elevation Reached |
| 685247.6 | 601452.5 | -5.2 | 163-SB-021 | 2/19/2016 | -7.2 | Target Elevation Reached |

1 This is the actual elevation of the PDI sample included with the approved Figure 1 - Site 163 Additional Chromium Excavation Areas dated 9/22/15.

2 Elevation -8.3 ft. was coincidental with the top of Stratum D.

**Maser Consulting P.A. certifies that the elevations, with their corresponding date obtained, of the Confirmatory Points depicted in Table 1, Sidewall Confirmatory Sidewall Points Table 2 and Bottom of Excavation topographic spot elevations are correct, and representative of the as-built post-excavation grades.**

## GENERAL NOTES

1. THE SOLE PURPOSE OF THIS PLAN IS TO SHOW POST-EXCAVATION ELEVATIONS WITHIN THE SA6 SOUTH, SITE 163 & SITE 60 KELLOGG EXCAVATION AREAS AT THE PROJECT SITE.
2. POST-EXCAVATION LOCATIONS AND ELEVATIONS WERE OBTAINED BY MASER CONSULTING P.A. ON MULTIPLE FIELD VISITS FROM 10/23/13 THROUGH 12/22/14, 1/4/16 THROUGH 3/4/16 & 6/10/16. POST EXCAVATION SURFACES AND CONTOURS WERE GENERATED BY ENTACT AND CONFIRMED BY MASER CONSULTING P.A. WITH MINOR ADJUSTMENTS.
3. HORIZONTAL DATUM NAD 1983, VERTICAL DATUM NGVD29.

GENERAL NOTES

1. THE SOLE PURPOSE OF THIS PLAN IS TO SHOW TOP OF STONE ELEVATIONS WITHIN THE SA6 SOUTH EXCAVATION AREAS AT THE PROJECT SITE.
2. STONE LAYER LOCATIONS AND ELEVATIONS WERE OBTAINED BY MASER CONSULTING P.A. AND ENTACT ON MULTIPLE FIELD VISITS FROM 10/5/16, 10/6/16, AND 10/20/16.
3. HORIZONTAL DATUM NAD 1983, VERTICAL DATUM NGVD29.

NOTE: NO HISTORIC FILL SHALL BE PLACED ON SA–7

TYPICAL VEGETATED SLOPE
NTS

NOTE:

1. REFER TO FIGURE 2 FOR CONSTRUCTION CONTROL GRID AND ATTACHED TABLES FOR SURVEY DOCUMENTATION OF 6 INCH GRAVEL HISTORIC FILL CAP INSTALLATION.
2. OPEN SPACE CAP AREA WITHIN LIMITS OF THE BARRIER WALLS IS COVERED WITH CLEAN IMPORTED SOILS TO THE DEPTHS IDENTIFIED IN THE DESIGN. THE VEGETATED SLOPE ON THE DEVELOPMENT AREA IS COVERED WITH A MINIMUM OF 12 INCHES OF CLEAN IMPORTED FILL AS SHOWN ON THE TYPICAL VEGETATED SLOPE DETAIL. THE VEGETATED SLOPE ALONG SA–7 WAS CONSTRUCTED ENTIRELY FROM CLEAN IMPORTED FILL.
3. EXISTING PAVEMENT WAS FIELD INSPECTED BY LSRP AND SUBJECT TO MINOR CRACK FILLING TO SATISFY HISTORIC FILL CAP REQUIREMENTS.
4. STEEL SHEETPILE WALL WAS INSTALLED AS EXCAVATION SUPPORT ALONG THIS AREA AND THEN CUT BELOW CURRENT GRADE AND LEFT IN PLACE. THE TOP OF SHEETPILE IS GENERALLY 0.5 TO 2.0 FT BELOW CURRENT GRADES.

Attention: Mr. Geoff Shallard

Re: Area 1S Surcharge Review
SA-6 South
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) October 27, 2014 review of Area 1S indicated settlement monitoring location S_FS-02 did not meet the defined surcharge program goal as of September 23, 2014. AMEC provided MRCE with updated settlement and piezometer monitoring data for Area 1S location S_FS-02 on April 14, 2015. The MRCE review of April 14, 2015 AMEC settlement and piezometer monitoring data for Area 1S location S_FS-02 is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated November 18, 2014 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressure. Post-surcharge total stress was calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken on November 25, 2014. Calculated post-surcharge effective stress for S_FS-02 is presented in Table 1. MRCE compared the calculated post-surcharge effective stress with the "Final Post-Development Conditions" effective stress estimate provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 1S monitoring locations have met the surcharge program goal as of November 25, 2014.

Very truly yours,

**MUESER RUTLEDGE CONSULTING ENGINEERS**

Attention: Mr. Geoff Shallard

Re: Area 2S Surcharge Review
SA-6 North
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of February 06, 2015 AMEC settlement and piezometer monitoring data for Area 2S is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated between January 12-29, 2015 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken at corresponding dates, between January 14-30, 2015. Calculated post-surcharge effective stresses are presented in Table 1. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 2S monitoring locations have met the surcharge program goal as of 01/30/2015.

Very truly yours,
**MUESER RUTLEDGE CONSULTING ENGINEERS**

Attention: Mr. Geoff Shallard

Re: Area 3S Surcharge Review
SA-6 South
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of March 30, 2015 AMEC settlement and piezometer monitoring data for Area 3S is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated between March 24-13, 2015 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken on March 19, 2015. Calculated post-surcharge effective stresses are presented in Table 1. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 3S monitoring locations have met the surcharge program goal as of 03/30/2015.

Very truly yours,

**MUESER RUTLEDGE CONSULTING ENGINEERS**

AMEC Environmental & Infrastructure
511 Congress Street
Portland, ME 04101

Attn: Mr. Samuel G. Shallard
Re: DC 03-04-15
Area 3S Surcharge Pile Geometry on East End
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

This letter is in response to DC-03-04-15 "3S Surcharge Pile Geometry on East End," which requests change of the surcharge program at Area 3S to eliminate surcharge pre-load of a small area at the east end of the fill along the west side of Route 440.The April 24, 2015 MRCE letter summarized the settlement and piezometer monitoring data and confirmed that all monitoring locations in Area 3S satisfied the surcharge program goals. However, MRCE was not aware of the request of DC-03-04-15 at that review.

AMEC suggested that truncating the eastern tip of the wedge shaped surcharge fill will not significantly affect the goals of the Remedy/Surcharge program since the change in grade is from 0 – 5 ft. MRCE agrees with AMEC that since the increase in final grade is small, surcharging will have no significant affect. MRCE also reviewed available geotechnical data for the area in question, and finds that the compressible strata is pre-loaded such that no settlement will occur.

**Examining Pre-Consolidation Stress**

MRCE reviewed the soil profile closest to the "Deferred Area" and laboratory testing for compressible Stratum D. Boring location plan and summary of consolidation tests for Stratum D are attached (see Drawing B-1, Figure S-1, Plate 13 & Plate 18). The pre-consolidation stress (P'c) of the compressible layer Stratum D was tested for design of the Study Area 7 remediation. This test data was used to compute the pre-consolidation stress using two methods. The first method calculated the average P'c from the laboratory consolidation tests, resulting in P'c = 1930 psf. The second method calculated the effective overburden pressure at midpoint of Stratum D and multiplied it by the average OCR (overconsolidation ratio) defined by consolidation testing. With the average OCR = 2.23 and the average effective overburden stress = 1064 psf, the resulting average P'c = 2372 psf.

(see Appendix A). Settlement would only occur at the compressible layer if the effective stress due to filling exceeds 1930 to 2372 psf.

**Estimated Stress at Final Conditions**

Based on DC-03-04-15, the final grade will increase by 0 to 0.5 ft. The additional soil placed on top of the 12 ft wide area ranges from a height of 0 to 3 ft. Assuming an average height of the added soil as 1.5 ft and the maximum increase of grade, the final effective stress at the midpoint of Stratum D = 1314 psf, which is less than the lower bound of P'c = 1930 psf. (see Appendix A)

Since the effective vertical stress due to the final grade including planned added soil is less than the P'c of Stratum D, no settlement is expected. This technical review supports the AMEC evaluation that surcharging is not needed in the area addressed by DC-03-04-15.

Very truly yours,

SUBJECT CALCULATION OF STRESSES

## APPENDIX A

① Using average Pc from consolidation tests:

Pc (SB-210D) = 0.53 tsf = 1060 psf

Pc (SB-211D) = 1.4 tsf = 2800 psf

Pc (average) = 1930 psf

② Using OCR from consolidation tests:

At ELEV. -2.5 ⇒ $\sigma'_v$ = 120pcf x 13.5 ft − 62.4pcf x 10 ft

= 1064 psf

OCR(SB-210D) = 1.77

OCR(SB-211D) = 2.69

OCR(average) = 2.23

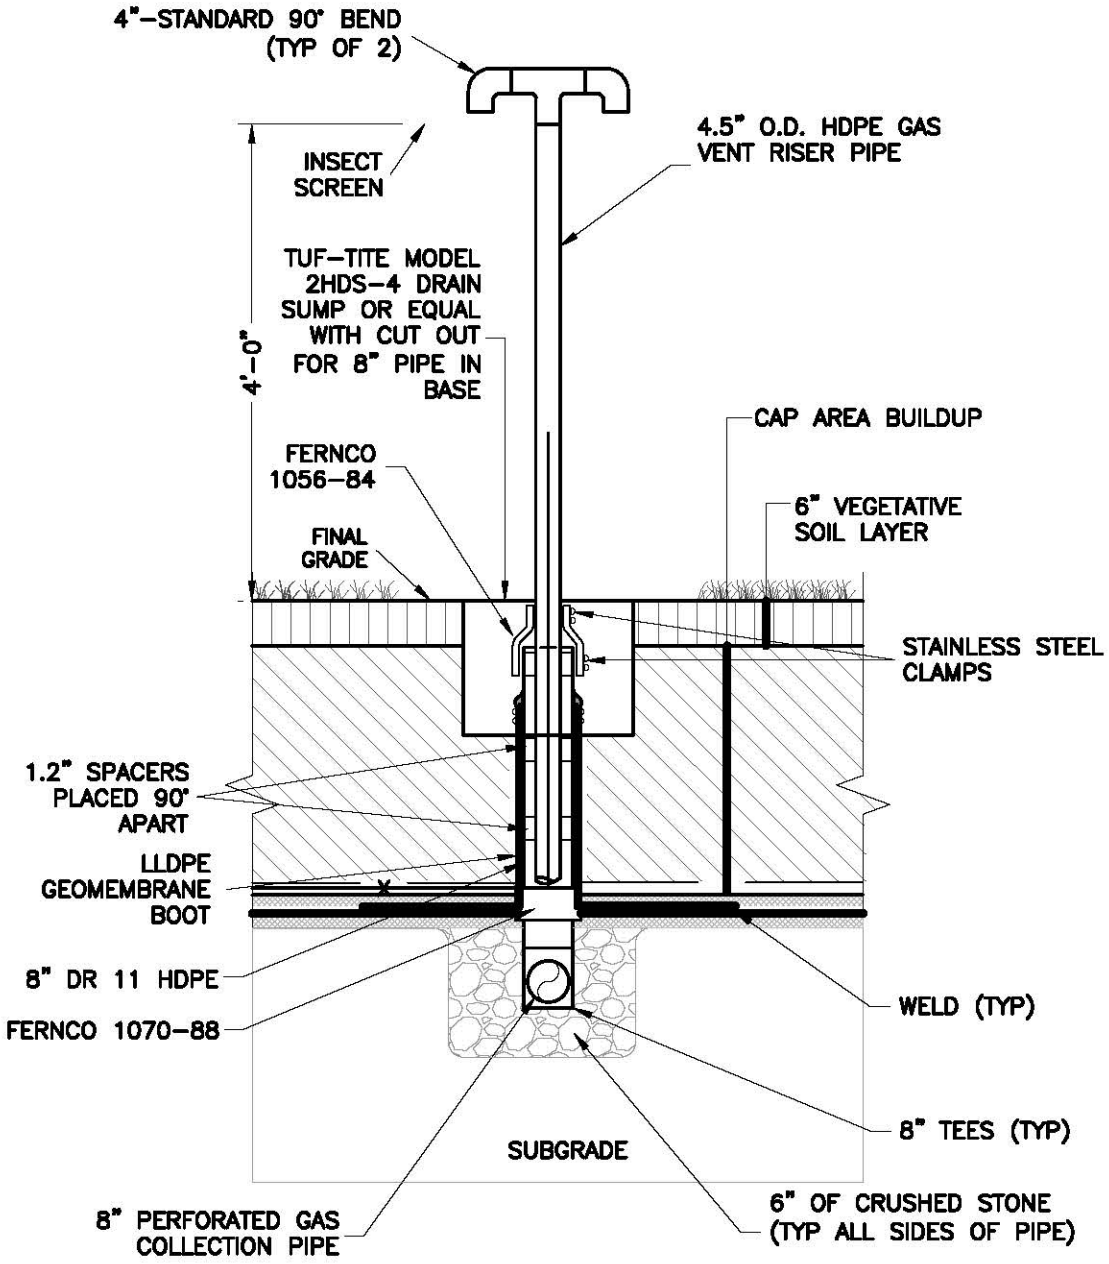
1064 psf x 2.23 = 2372 psf

AVERAGE ① & ② = 2151 psf

③ Stress at Final Condition

Final Effective overburden stress:

$\sigma'_{vf}$ = 1064 + (1.5+0.5) x 125pcf



= 1314 psf < 1930 psf

Added soil avg height = 1.5'

Max. increase in grade = 0.5'

# DESIGN CHANGE BULLETIN LOG

| SA-6 North/South Field Change Log | | | | | |
|---|---|---|---|---|---|
| **AmecFW ID** | **Changed Item Identifier** | **Description of Change** | **Comments** | **Site** | **AOC Designation[1]** |
| **1** | **DC 2013-7-29** | Surcharge Monitoring Plan modifications to match changes associated with relocation of the hydraulic barrier wall near the 72" force main. 72-Inch Force Main Monitoring Layout Plan, Details, and Notes developed. Surcharge pile layout redesign and instrumentation adjustments. The format of the Daily Report, Instrumentation Installation Forms, and Monitoring Data Forms has been modified to allow for generation using a "tablet application". | Submitted to all Parties on March 12, 2014. | SA-6 North & SA-6 South | A, C |
| **2** | **DC 2013-8-14 (HB Wall)** | Modifications to the Barrier Wall alignment and Surcharge Program to address concerns of NJDEP/PVSC/JCMUA and Honeywell regarding protection of 72 inch force main. Design drawings have been modified and design calculations revised in support of the required modifications to subgrade/liner grading and final grades. | Submitted to all Parties on September 12, 2013. | North | A |
| **3** | **DC 2013-8-14 (Grouted Angles)** | The area indicated on sheets S-201 to S-203 from Station 0+00 to 17+80 will be sealed with a cement bentonite grout in lieu of hydraulic sealant. This area will include a grouted angle. | Contingency to Expand Use of Grouted Joint Called out in 100% Design. Submitted to Contractor only as clarification or response to RFI. | South | C |
| **4** | **DC 2013-9-12** | Hydraulic barrier alignment for SA-6 South between 21+00 and 22+00 to be straightened. Stationing from 21+00 on is to be adjusted to account for the elimination of the 3-ft offset in the wall. | Minor alignment adjustment now that Boatyard Property transaction to Bayfront completed. Submitted to Contractor only as clarification or response to RFI. | South | C |
| **5** | **DC 2013-9-24** | Testing frequency for analytic parameters for imported borrow material is to be modified to 1 test/5,000 CY of borrow. | Honeywell directive to be more conservative than 100% Design. Submitted to Contractor only as clarification or response to RFI. | SA-6 North & SA-6 South | A, B, C, D, E |
| **6** | **DC 2013-12-12** | The proposed bottom of excavation elevations may be deepened as required to expose Post-Excavation Samples as reported on the revised PDI summary tables which were submitted to Parties in HON/Amec Response to Comments dated 02/06/14. | In addition to the periodic notice of excavation complete emails to the Parties, Honeywell submitted the following documents that further defined excavation extents, updated PDI Tables (converted to elevations), Colorized Area Excavation Depth Drawing, and procedures to certify those extents:<br>1) 2/6/14 RTC letter on 1/28/14 & 1/31/14 Plaintiff comment letters Re: Cells 17 - 29.<br>2) 3/3/14 SA-6 South Standard Operating Procedure, Confirmation of Excavation Limits.<br>3) 4/17/14 RTC letter on 4/11/14 Plaintiff comment letters Re: Cells 44 - 52.<br>4) 4/24/14 Revised SA-6 South Standard Operating Procedure, Confirmation of Excavation Limits. | South | D, E |
| **7** | **DC 2014-3-25** | Change Contingent GW system from wells to trench on both SA-6 S and SA-6N. | Submitted to all Parties on March 25, 2014 and April 23, 2014. | SA-6 North & SA-6 South | A, C |
| **7.1** | **DC 2014-6-10** | AmecFW documented the SA-6 Contingent Groundwater system change to a trench system. The design will be released to Entact in stages to facilitate constructability. DC 2014-6-10 includes the french drain installation, as well as pump and access station manholes for SA-6 South. Some design details, including the electrical design, will be finalized based field observations and constructability review. | Submitted to Parties as Attachment to Declaration 002 response memo on July 19, 2016 | South | C |
| **7.2** | **DC 2014-11-20** | AmecFW documented the SA-6 Contingent Groundwater system change to a trench system. The design will be released to Entact in stages to facilitate constructability. DC 2014-11-20 includes the french drain installation, electrical supply and discharge piping for SA-6 North. | Submitted to Parties as Attachment to Declaration 002 response memo on July 19, 2016. | North | A |
| **7.22** | **DC 2016-6-6** | AmecFW documented the SA-6 Contingent Groundwater system change to a trench system. The design will be released to Entact in stages to facilitate constructability. DC 2016-6-10 includes the revised electrical supply and discharge piping for SA-6 North. | Submitted to Parties as Attachment to Declaration 004. (Design Change ID changed from DC 2016-6-10 to DC 2016-6-6 to reflect actual date on Design Change form). | North | A |
| **7.3** | **DC 2015-2-12** | AmecFW documented the SA-6 Contingent Groundwater system change to a trench system. The design will be released to Entact in stages to facilitate constructability. DC 2015-2-24 is a follow up to DC 2014-6-10, the SA-6 South CGWES trench design. DC 2015-2-24 includes details for electrical supply and discharge piping. | Submitted to Parties as Attachment to Declaration 002 response memo on July 19, 2016 | South | C |
| **7.4** | **DC 2015-9-03** | AmecFW documented the SA-6 Contingent Groundwater system change to a trench system. The design will be released to Entact in stages to facilitate constructability. DC 2015-9-03 is a follow up to DC 2015-2-24, the SA-6 South CGWES electrical supply. DC 2015-9-03 provides a revised electrical plan. | Submitted to Parties as Attachment to Declaration 002 response memo on July 19, 2016 | South | C |
| **7.4.1** | **DC 2016-5-24** | AmecFW documented the SA-6 Contingent Groundwater system change to a trench system. The design will be released to Entact in stages to facilitate constructability. DC 2016-5-24 was issued to address the elimination of a drop structure, the elimination of a flow meter, conduit sizing changes, and to clarify Entact's scope. | Submitted to Parties as Attachment to Declaration 002 response memo on July 19, 2016 | South | C |
| **7.4.2** | **DC 2016-12-20** | This DCB documents a number of minor field changes that have been conveyed by the EOR to Entact during the course of the work and also includes revisions to the (E series) electrical drawings for both SA-6N and SA-6S. | Included as an attachment to Declaration 005. | SA-6 North & SA-6 South | A, C |
| **7.5** | **DC 2015-2-24** | AmecFW documented the SA-6 Contingent Groundwater system change to a trench system. The design will be released to Entact in stages to facilitate constructability. DC 2016-5-24 was issued to document the changes in the SA-6 North and South cap subgrades that resulted from the change to a trench system. | Submitted to Parties as Attachment to Declaration 002 response memo on July 19, 2016 | SA-6 North & SA-6 South | A, C |
| **8.1** | **DC 2013-8-14 (Surcharge)** | Modify surcharge pile toe of slope to reduce load on the bulkhead. | Submitted to all Parties on July 10, 2014. | South | C, D |
| **9** | **DC 2014-5-6** | Excavate down to 4 ft bgs (instead of 3 ft bgs) in a portion of the Site 163 excavation area. | 5/6/14 letter from Honeywell summarizing the ERFS Site Vision field testing program indicated that this portion of Site 163 would be excavated instead of treated in-situ. | South | E |
| **10** | **DC 2014-5-19** | Defer removal of concrete/asphalt berm, demolition of subsurface concrete, and excavation to design elevations in the SA-6 South excavation area adjacent the bulkhead. | Submitted to all Parties on May 19, 2014. | South | D, E |
| **11** | **DC 2014-7-28** | Update the list of monitoring wells to be abandoned / retained. | Submitted to all Parties on August 26, 2014. | SA-6 North & SA-6 South | A, B, C, D, E |
| **12** | **DC 2014-10-28** | Direction on the handling of petroleum soils under the cap. | Submitted to all Parties on November 19, 2014. | South | C, D |
| **13** | **DC 2014-8-13** | Revised hydraulic barrier wall alignment through the sedimentation basin to reduce potential conflict with existing timber piles. | Submitted to all Parties on August 19, 2014. | North | A |
| **14** | **DC 2014-9-2** | Revised hydraulic barrier wall alignment adjacent the 72" force main in order to provide a clearance of 25 ft. between the centerline of the 72" force main and the barrier wall as previously agreed with PVSC. | Submitted to all Parties on September 4, 2014. | North | A |

| **15** | **DC 2014-10-31** | Revised Soil Management Plan (Appendix G - SA-6 North 100% Design Report) to indicate that any asphalt or concrete that meets NJDEP reuse requirements or is granted a variance by the NJDEP may be reused as backfill or placed underneath the cap.<br>Contractor directed to consolidate arsenic-impacted asphalt in Cap Areas in a footprint that does not exceed 44,000 SF and to cover the asphalt with chromium-impacted soil. | Submitted to Contractor only as clarification or response to RFI. | SA-6 North & SA-6 South | A, B, C, D, E |
| **16** | **DC 2014-12-01** | The Southern limits of the Site 163 Chromium remediation extend close to the existing bulkhead. The bulkhead is in a dilapidated condition and has deteriorated subsequent to design of the remedy. During implementation of the remedy the condition of the bulkhead was visually assessed. As a result of this assessment it was determined that it was necessary to add additional protection to the backfill placed in Site 163 pending installation of the permanent replacement bulkhead. The design was modified in the field to include placement of geotextile fabrics and a sloped rip-rap facing to provide additional protection to the backfill. | Submitted to Contractor only as clarification or response to RFI. | South | E |
| **17** | **DC 2015-01-22** | In accordance with the 100% Design, the Contractor is directed to remove 0-2 feet of <20 mg/kg overburden historic fill soils from selected locations throughout the SA-6 North Open Space Area. This will create a nominal 10,000 to 12,000 cubic yards (CY) additional capacity under the SA-6 North liner without affecting final grades for the liner or cover soils. The SMP allows such soils that are confirmed to be below 20 mg/kg for hexavalent chromium, to be used as temporary surcharge in the cap areas, backfill for excavations, or to raise the grades for the Redevelopment Project outside of the cap areas. In the space created by this removal of the 0-2 feet of historic fill soils from selected locations throughout the SA-6 North Open Space Area, the Contractor will relocate an additional estimated 10,000 to 12,000 CY worth of 20-240 mg/kg hexavalent chromium soils currently staged at SA-6 South. | Submitted to Parties as Attachment to Declaration 004. | SA-6 North & SA-6 South | A, B, C, D, E |
| **18** | **DC 2014-12-23** | During shallow excavation along the cove on Site 163, unreinforced mass concrete and a steel structure were identified in direct contact with structural components of the bulkhead. The structures will be left in place and remediation will be completed with the other SA-6 South bulkhead deferral area along the river, once the permanent bulkhead is installed. The total volume of the three isolated areas left in place is estimated to be 35 cubic yards. | Submitted to all Parties on January 28, 2015. | South | E |
| **19** | **DC 2015-03-03** | Mueser Rutledge Consulting Engineers (MRCE) have revised the design for temporary excavation support in SA-6 North along Route 440. Revised drawings SN-501, SN-502, SN-503, SN-504, and SN-505 are included in this Design Change Bulletin. | Submitted to Contractor and BMUA/JCMUA. Submitted to all Parties on 5/27/15. | North | A, B |
| **20** | **DC 2015-03-30** | A pile cap was encountered during pre-trenching at the general location of the demolished Waste Management Garage. An alternatives evaluation was conducted and it was concluded that the least risk option was to re-align the wall to the south effectively resulting in a decrease in the cap area and an increase in the EA-5 Excavation. | Submitted to all Parties on 5/27/15. | North | A |
| **21** | **DC 2015-03-04** | The surcharge pile has been constructed to the design height of the barrier wall. The strip or land between the barrier wall and the property line is one of the "deferred areas" and varies in width from 0 to 12 feet. Final Development grades east of the barrier wall are at essentially the same grade as the existing grade. As such there is no additional load generated by the development grades and therefore there is no necessity of surcharge. | Submitted to Parties on July 2, 2015. | South | C |
| **22** | **DC 2015-03-09** | The utility pole relocations along Route 440 require the installation of new poles in the DOT Right of Way along Route 440. The DCB includes the pole sleeve construction details and locations. | Submitted to Contractor only as clarification or response to RFI. | North | B |
| **23** | **DC 2015-04-30** | A concrete protuberance was encountered 12-13 feet below grade, which prevented driving the sheet to full depth immediately adjacent the JCIA trash pit. The closure sheet was notched to clear the concrete, then lowered to design depth. | Submitted to Contractor only as clarification or response to RFI. | North | A |
| **26.1** | **DC 2015-05-19** | Supply and installation of specific components related to the contingent groundwater system will be deferred pending closure of the caps and stabilization of the groundwater levels and quality within the contingent groundwater system on both SA-6 North and SA-6 South. | Submitted to Parties as Attachment to Declaration 002 response memo on July 19, 2016 | SA-6 North & SA-6 South | A, C |
| **27** | **DC 2015-06-18** | Bayfront Redevelopment Civil Designer has eliminated one utility corridor along the eastern portion of SA-6 South (water main and sewer line were relocated to another utility corridor).<br>In addition, it was identified that minor increases in the Bayfront final grades of up to 0.25 feet may be made in the landscaped areas (no changes were made to the roadway grades). The difference between the adjusted Geomembrane Subgrade surface and Final Grade surface has been verified to meet the minimum and average requirements of the SA-6 South Consent Decree and the 100% Design. | Submitted to all Parties on June 18, 2015. | South | C |
| **28** | **DC 2015-05-29** | Details were revised in order to clarify cap termination beyond the SCB/VHB wall, GCL to SCB/sheetpile barriers and Geofoam Block locations above the liner. | Submitted to Parties on August 27, 2015. | South | C |
| **29** | **DC 2015-06-05** | Amec Foster Wheeler reviewed the piezometer locations shown in the IFC design with the latest road and utility designs prepared by CHA. This has resulted in minor movements of the piezometers. The movement will have no impact on the performance of the piezometers to meet their intended purpose for measurement of the hydraulic gradient across the wall. | Submitted to Parties on August 27, 2015. | South | C, D |
| **30** | **DC 2015-11-12** | Amec Foster Wheeler has provided Final Cap Grades (in CAD) to Entact. Amec Foster Wheeler and Entact developed a methodology for adapting grading of the cover soils to offsets from either subgrade or Final Development Grade. The methodology was described in the response to RFI 057. Some minor changes (0.1 to 0.2 ft.) have also been made in localized areas to improve surface drainage. | Included as an attachment to Declaration 005. | South | C, D, E |
| **30.1** | **DC 2016-04-15** | Amec Foster Wheeler has provided final restoration grades for SA-6 South Development Area. The DCB also includes the final cover types in revised Drawing C-128. | Included as an attachment to Declaration 005. | South | C, D, E |

| SA-6 North/South Field Change Log | | | | | |
|---|---|---|---|---|---|
| **AmecFW ID** | **Changed Item Identifier** | **Description of Change** | **Comments** | **Site** | **AOC Designation[1]** |
| **30.2** | **September 2016-South** | The design change documents revisions to the final grading and SESCP drawings on the SA-6 South Chromium Remedy. Minor grading changes were performed in the field to improve surface drainage. In addition, the extent of demarcation fabric, crushed stone and DGA placed over the Development Area was increased to meet historic fill regulations. SESCP changes included installation of crushed stone toe drain along SA-7, installation of erosion mat, installation of supplemental diversion berms, and installation of stone check dams. | Included as an attachment to Declaration 005. | South | C, D, E |
| **32** | **DC 2015-06-18 (South)** | Amec Foster Wheeler and ERFS performed in-situ injections of calcium polysulfide (CAPS) at SA-6 South, Site 163 in July & August 2014. 6-month performance assessment soil samples were collected and analytical results indicated that seven of the fifteen treatment areas at the Site are now <20 milligrams per kilogram (m/kg) for Cr(VI). Honeywell will implement additional CAPS injections at several of the areas that remain >20 m/kg for Cr(VI). While the specific scope of this next field phase is provided in the attachment, the work will generally be performed in accordance with Amec Foster Wheeler's approved Work Plan for In-Situ Treatment of Chromium Impacted Soil, dated September 2012. | Submitted to all Parties on 6/22/15. | South | E |
| **33** | **DC 2015-06-18 (North)** | Injections of calcium polysulfide (CAPS) will be implemented in a limited portion of TA-10, north of the northern curbline for the future Stegman Boulevard to be constructed during the Bayfront Redevelopment project. Monitoring wells installed in the injection area and between the injection area and the adjacent 72- inch force main will be used to measure sulfate conditions in shallow groundwater. If necessary, clean potable water may be injected into the monitoring wells to dilute the sulfate concentrations in the shallow groundwater adjacent to the 72-inch force main. While the specific scope of the proposed injections is provided in the attachment, the work will generally be performed in accordance with Amec Foster Wheeler's approved Revised Work Plan for In-Situ Treatment of Chromium Impacted Soil, dated February 19, 2013. | Submitted to all Parties on 6/22/15. | North | B |
| **34** | **DC 2015-06-15** | A Construction Control Grid for the SA-6 cap subgrade was developed in CAD as a Triangular Irregular Network for construction control and verification of compliance with cover thickness requirements in the Consent Decree and Open Space Design Standards. | Submitted to Parties on August 27, 2015. | South | C |
| **35** | **DC 2015-07-16** | The alignment of the gas vent system piping and trench was modified in the west portion of the SA-6 South cap to establish smooth grades in the utility corridors and avoid contingent groundwater extraction system components. | Submitted to Parties on August 27, 2015. | South | C |
| **35.2** | **DC 2015-08-18** | The Design detail (Drawing C-121, Detail AN) assembly has been modified to reflect changes resulting from collaboration between Entact and AmecFW. | Submitted to Parties on August 27, 2015. | South | C |
| **35.3** | **DC 2015-10-06** | GCL is required to be installed over the SCB wall and Barrier Wall at the locations shown in the annotated PDF of C-121 (rev 4, 8/13/15). | Submitted to Contractor only as clarification or response to RFI. | South | C |
| **36** | **DC 2015-07-22** | Detail BN has been modified to extend the LLDPE up and over the SCB Wall. The prior detail showed both the GDL and geomembrane terminating at the wall. | Submitted to Parties on August 27, 2015. | South | C |
| **37** | **DC 2015-07-28** | Drawing 304, Detail CE and associated notes regarding the "Liner Anchor to Concrete Structure" have been modified. | Submitted to Contractor only as clarification or response to RFI. | South | C |
| **37.2** | **DC 2015-08-07** | AmecFW has conducted further review of the "Liner to Concrete Structure Detail" (Drawing C-304, Detail CE) with Entact/ESI, including field review, to improve constructability. | Submitted to Contractor only as clarification or response to RFI. | South | C |
| **38** | **DC 2015-07-31** | The sheet pile pair is located at Sta. 0+50. Driving was stopped with a top elevation of +12.8 and a tip of -2.2. The top of meadow mat is at elevation +0.5. In accordance with the 100% Design Report (10.1.3 Bottom Key), the tip of the sheet shall be embedded a minimum of 2' into the Stratum D. The tip of the sheet is embedded 2.7 ft. and therefore meets the design criteria which was established in accordance with the requirements of the Consent Decree. | Submitted to Contractor only as clarification or response to RFI. | North | A |
| **39** | **DC 2015-07-30** | Entact was granted approval to install a wedge of soil in the B Street corridor against the SCB wall. There is a step up in this location from the corridor subgrade to the top of the SCB wall. The intent of the Entact request was to provide a more gradual transition between the corridor subgrade and SCB Wall. AmecFW reviewed the CHA utility drawings and determined that there were no utility structures within this location that would be impacted by the change i.e. the change has no impact on the future development. The remaining corridor to SCB wall detail will be installed as shown on the contract drawings. | Submitted to Contractor only as clarification or response to RFI. | South | C |
| **41** | **DC 2015-08-19** | Entact notified AmecFW that the vendor had experienced difficulty during set up and could not produce an acceptable quality of lettering on the orange non-woven geotextile (due to ink blurring). As an option Entact proposed installing a standard direct burial utility marking tape. AmecFW approved use of a 6 inch wide yellow PE tape with 3.5 inch bold back lettering as meeting the specified requirements for a distinctive colored high visibility marking. | Submitted to Parties on August 27, 2015. | SA-6 North & SA-6 South | A, C |
| **42** | **DC 2015-08-21** | The anchor trench section of the Specification 02372 CAP GEOMEMBRANE LINER Section 3.02 is standard industry language and part of AmecFW's standard Geomembrane Specification. During the process of finalizing development of the capping system in the 100% Design, the Engineer determined that anchor trenches were not required for either the SA-6N or SA-6S Caps. As such, Paragraph 3.02 is no longer required and therefore the following is deleted in its entirety. | Submitted to Parties on August 27, 2015. | SA-6 North & SA-6 South | A, C |
| **43** | **DC 2015-08-20** | The most easterly utility corridor was eliminated from the Development Plan, allowing for a revision to the cap subgrade and related revisions to the top of the Barrier Wall (revised Drawing S-201). Addendum: The top of the SCB wall will also be revised to reflect the elimination of the utility corridor (revised Drawing S-204). | Submitted to Parties on August 27, 2015. | South | C |
| **45** | **DC 2015-9-02** | As identified in the 100% Design, ENTACT should now remove approximately 2 ft. of historic fill from the post surcharge removal surface of Area 1N to create capacity for 20-240 mg/kg chromium impacted soils. Excavated Soils will be sampled and analyzed according to the Soil Management Plan. Should any excavated historic fill exceed the 20 mg/kg criteria, it will be placed under the cap. | Submitted to Parties as Attachment to Declaration 004. | North | A |

| SA-6 North/South Field Change Log | | | | | |
|---|---|---|---|---|---|
| **AmecFW ID** | **Changed Item Identifier** | **Description of Change** | **Comments** | **Site** | **AOC Designation[1]** |
| **46** | **DC 2015-9-17** | Extensive searching of available soil suppliers (including 6 specifically identified as potential sources/vendors by Dr. Grabosky) indicated that current sources could substantially meet the most critical, but not all, IFC specifications. In response, AmecFW submitted the provided borrow source testing data per specifications to Dr. Grabosky for his review. Dr. Grabosky selected specific blends from the list that he identified as acceptable for use within the Open Space Areas. In addition, Dr. Grabosky recommended minor revisions to the specifications that the AmecFW engineer has accepted. Dr. Grabosky's letter and specification revision recommendation are attached. | Submitted to Parties on September 23, 2015. | SA-6 North & SA-6 South | A, C |
| **47** | **DC 2015-9-04** | EA-8 boundaries have been revised to reflect additional sampling following initial excavation as defined in the 100% Design. The internal boundaries delineating the different soil disposition based on hexavalent chromium content have been revised. The revisions are minor in nature and are based on using a means of interpolation between sample points that is consistent with that used on SA-6S. | Submitted to Parties as Attachment to Declaration 003. | North | B |
| **47.1** | **DC 2015-11-18** | Drawing CN-118 has been revised to show additional excavation in EA-8 as outlined in DC 2015-09-04. In addition, review of DC 2015-09-04 indicated a small area where the 20 - 240 ppm hatch had not been carried to the outer limit of excavation. The hatch mark has been corrected in CN-118 revision 2. | Submitted to Parties as Attachment to Declaration 003. | North | B |
| **48** | **DC 2015-09-28** | Chromium-impacted soils within the residential footprint of Site 163 that remained at levels above 20 ppm hexavalent chromium after in-situ treatment will be excavated in lieu of additional in-situ treatment and further sampling. | Submitted to Parties on October 1, 2015. | South | E |
| **48.1** | **DC 2015-12-21** | Amec Foster Wheeler (AmecFW), Entact and Maser Consulting have developed alternative methods for documentation/survey of the excavation bottom in Site 163. The alternative methods were developed in light of safety considerations for surveyor access into a sheet piled excavation to elevation –8.0. The bottom of the excavation will be in very low strength Stratum O soils. These alternative survey control methods are different from those previously used in the SA-6 South Development Area. | Submitted to Contractor only as clarification or response to RFI. | South | E |
| **50** | **DC 2015-10-02** | As an additional precautionary measure, ENTACT will install warning tape directly on top of the root barrier layer. The warning tape will generally be installed perpendicular to the warning tape above the GDL. On the steep slopes into roadway/utility corridors and the tree planting areas the tape will be set running from the top of the slope to the bottom of the slope. | Submitted to Parties on October 8, 2015. | SA-6 North & SA-6 South | A, C |
| **51** | **DC 2015-10-22** | Pre-trenching on the vinyl sheetpile alignment revealed a significant number of old timber piles along the western edge of the proposed repair. Removal of the piles would create openings in the Stratum D. In lieu of removing sheetpile, the western side was relocated approximately 6 ft. further west. This will result in an expansion of the repair plan area from approximately 14,000 SF to approximately 14,500 SF. This change has no impact of the functionality of the chromium remedy or on the future site development. | Submitted to Contractor only as clarification or response to RFI. | North | B |
| **52** | **DC 2015-12-14** | Specification 02372, Sections 3.03 – Geomembrane Placement, C. Liner Boots and 3.06 – Field Quality Control, B. Nondestructive Seam Testing have been amended to include spark testing of extrusion welds that cannot be tested by other means. Spark testing will be performed in accordance with ASTM D6365 - Standard Practice for the Non Destructive Testing of Geomembrane Seams using the Spark Test. In addition, GRI-19 - Specification Seam Strength & Related Properties of Thermally Bonded Polyolefin Geomembrane was added as a reference document. The Specification also requires preparation of a Spark Testing form for each location that Spark Testing is used, to be signed by the Independent Geosynthetics QA representative.<br>Agreement was reached between Honeywell and the Plaintiffs to implement Spark Testing on SA-6N. Specification 02372 has been revised accordingly. | Submitted to Parties on January 14, 2016. | North | A |
| **53** | **DC 2015-11-30** | EA 2&3 external boundaries remain consistent with the Issued for Construction Design. Internal waste classification boundaries required adjustment to clarify the limits in three small triangular areas within the main excavation. A complete set of EA 2&3 Drawings and AutoCAD Files have been included showing all intervals. EA-8 Issued for Construction defined excavation limits from the surface to elevation 7. Upon reaching elevation 7 supplemental sampling was conducted and excavation conducted based on those results. Observation of excavation faces revealed a suspect area that subsequent testing verified required removal. A further round of supplemental sampling established new excavation limits. A detail is shown on the Interval 6 drawing showing the extent of extra excavation required. | Submitted to Parties as Attachment to Declaration 003. | North | B |
| **54** | **DC 2016-02-02** | The interim grade in the SA-6 North landscape area has been raised by a nominal amount of 0.25' (no changes were made to the roadway grades). The difference between the adjusted Geomembrane Subgrade surface and Interim Grade surface has been verified to meet the minimum and average requirements of the SA-6 North Consent Decree and the 100% Design. | Submitted to Parties as Attachment to Declaration 004. (Design Change ID changed from DC 2016-02-03 to DC 2016-02-02 to reflect actual date on Design Change form). | North | A |
| **54.1** | **DC 2016-02-22** | AmecFW revised the SA-6 North cap subgrade in a single localized area in order to accommodate Entact's request to relocate Pump Station #1 (RFI 64). The subgrade has been lowered at the new location to accommodate the vault and piping, and raised in the original pump station location.<br>In addition, for grading purposes, any hydraulic barrier sheets within the Sedimentation Basin that have sections below elevation 12.0 will be trimmed to a uniform elevation of 11.5. | Submitted to Parties as Attachment to Declaration 004. | North | A |
| **54.2** | **DC 2016-02-25** | This DCB has been issued to provide Entact with the latest SA-6 North HB Wall and SCB wall plan and profile drawings (SN-201 thru SN-205), which were modified to reflect changes made in DC 2016-02-22. | Submitted to Parties as Attachment to Declaration 004. | North | A |
| **54.3** | **DC 2016-5-11** | The interim grade in the SA-6 North landscape area has been raised by a nominal amount of 0.25' (no changes were made to the roadway grades). The difference between the adjusted Geomembrane Subgrade surface and Interim Grade surface has been verified to meet the minimum and average requirements of the SA-6 North Consent Decree and the 100% Design. As part of DC 2016-5-11, AmecFW issued SA-6 North Interim Grades to Entact. | Submitted to Parties as Attachment to Declaration 004. | North | A |

| SA-6 North/South Field Change Log | | | | | |
|---|---|---|---|---|---|
| **AmecFW ID** | **Changed Item Identifier** | **Description of Change** | **Comments** | **Site** | **AOC Designation[1]** |
| **54.4** | **DC 2016-5-20** | After further review, AmecFW lowered the geomembrane Pump Station #1 on the SA-6 North cap in order to provide additional separation between the geomembrane and the bottom of the vault. (Refer to DC 2016-02-22). | Submitted to Parties on June 15, 2016. | North | A |
| **54.5** | **DC 2016-7-14** | Design change documenting minor field changes needed to achieve positive drainage in the cap area. | Included as an attachment to November 2016 monthly progress report and included in the finalized Declaration 004. | North | A |
| **54.6** | **September 2016-North** | The design change documents revisions to the interim/final grading and SESCP drawings on the SA-6 North Chromium Remedy. Minor grading changes were performed in the field to improve surface drainage pending redevelopment. SESCP changes included installation of crushed stone toe drain along SA-7, installation of erosion mat, installation of supplemental diversion berms, and installation of stone check dams. | Included as an attachment to Declaration 005. | North | A |
| **55** | **DC 2016-05-03** | The laboratory results of all gradations for planting soils shall be presented in terms of the USDA classification system rather than the USCS classification system. | Submitted to Contractor only as clarification or response to RFI. | SA-6 North & SA-6 South | A, C |
| **56** | **DC 2016-03-18** | This DC 2016-03-18 documents the revised acceptable ranges of physical parameters and provides an updated specification made in consultation with Dr. Grabosky of Rutgers University. Dr. Grabosky provided his recommendations in correspondence dated 3/17/2016. | Submitted to Parties on March 22, 2016. Plaintiffs responded in a letter dated April 15, 2016. The Parties did not agree to implement this DCB as drafted. However, Plaintiffs and Honeywell subsequently held discussions and DCB 2016-4-20 was developed to document an agreement reached by all parties on the Special Master All-Hands monthly call on April 19, 2016. | SA-6 North & SA-6 South | A, C |
| **57** | **DC 2016-03-21** | Nature's Choice was identified as the source that best met the physical requirements for Horizon C soils by Dr. Grabosky; however, several samples of Nature's Choice Horizon C soils have hexavalent chromium concentration >1.0 mg/kg. Consequently, Honeywell is proposing a design change to allow the hexavalent chromium concentration in Nature's Choice Horizon C soils to be less than 1.8 mg/kg, as agreed to by the parties, as documented in the attached emails. For future sampling, hexavalent chromium soil samples will be composited from 10 grab sample locations per 5,000 CY (maximum). There are additional conditions in Attachment A that are part of this DCB and specific to Nature's Choice Horizon C soil. All other requirements specified in the 100% Design for imported soils will be met by the Nature's Choice Horizon C soils as amended in previous DC 2015-09-17. | Submitted to Parties on March 22, 2016. | SA-6 North & SA-6 South | A, C |
| **58** | **DC 2016-05-06** | To allow for traffic flow within the project site following completion of the SA-6S Cap, a road will be installed within the "B Street" corridor. The road will be constructed by continuing the "Structural Fill under Roadways to within 6 inches of final grade" | Submitted to Parties on June 30, 2016. | South | C |
| **59** | **DC 2016-04-20** | This DCB documents the approved sources of Horizon B and Horizon C materials, as agreed to by all parties on the Special Master All-Hands monthly call on April 19, 2016. | Submitted to Parties on April 21, 2016. | SA-6 North & SA-6 South | A, C |
| **60** | **DC 2016-05-31** | This DCB documents the vault sketch Drawing C-310 (Rev 5, 5/31/16) | Submitted to Contractor only as clarification or response to RFI. | South | C |
| **61** | **DC 2016-11-09** | The limits and the type of restoration north of the SA-6N cap has been modified to be integrated with the SA-6N Non Chrome Remedy. | Included as an attachment to Declaration 005. | North | B |
| **62** | **DC 2016-7-12** | DC 2016-7-12 clarifies the limit of GCL deployment and the location of the sand bentonite plug in the SA-6 North cap. | Included as an attachment to July 2016 Monthly Progress Report. | North | A |

**Notes:** All tracked changes will be reflected in the as-built drawings and Final Record Documents as agreed to with the Parties.

1) Area of Concern (AOC) Designations:
   A = SA-6 North Open Space Area
   B = SA-6 North Development Area
   C = SA-6 South Open Space AOC
   D = SA-6 South Kellogg Street Development AOC
   E = SA-6 South Site 163 Development AOC

# WELL PERMIT

New Well

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

New Well

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

New Well

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# Monitoring Well Certification Form B - Location Certification

Date Stamp
(For Department use only)

## SECTION A. SITE NAME AND LOCATION

Site Name: Development AOC Shallow Ground Water Wells 02-Site

List all AKAs: Honeywell SA6-South

Street Address: 200 Kellogg St.

Municipality: Jersey City (Township, Borough or City)

County: Hudson Zip Code: 07305

Program Interest (PI) Number(s): G000000927 Case Tracking Number(s): N.A.

## SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner Honeywell
2. Well Location (Street Address) 200 Kellogg St., Jersey City, Hudson County, NJ
3. Well Location (Municipal Block and Lot) Block# 24601 Lot # 1

## SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): E201601094
2. Site Well Number (As shown on application or plans): 073-MW-06
3. Geographic Coordinate NAD 83 to nearest 1/100 of a second:
   Latitude: North 40-42-52.52 Longitude: West 074-06-20.63
4. New Jersey State Plane Coordinates NAD 83 datum, US survey feet units, to nearest foot:
   North 685465 East 601414
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 11.50
   Elevation Top of Outer casing: 11.72 Elevation of ground: 9.01
   *Check one*: ☐ NAVD 88 ☒ NVGD29 ☐ On Site Datum ☐ Other
6. Source of elevation datum (benchmark, number/description and elevation/datum). If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation (referencing NAVD 88).
   NGS Bench Mark KV0272. Elevation = 36.37' (NGVD29). (Subtract 1.14' to convert elevation to NAVD88 datum)
7. Significant observations and notes:

## SECTION D. LAND SURVEYOR'S CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

Street Address: 80 Kellogg St.

Municipality: Jersey City (Township, Borough or City)

County: Hudson Zip Code: 07305

Program Interest (PI) Number(s): 003846 Case Tracking Number(s): N.A.

## SECTION B. WELL OWNER AND LOCATION

1. Name of Well Owner Honeywell
2. Well Location (Street Address) 80 Kellogg St., Jersey City, Hudson County, NJ
3. Well Location (Municipal Block and Lot) Block# 24601 Lot # 6

## SECTION C. WELL LOCATION SPECIFICS

1. Well Permit Number (This number must be permanently affixed to the well casing): E201601089
2. Site Well Number (As shown on application or plans): 140-MW-09
3. Geographic Coordinate NAD 83 to nearest 1/100 of a second:
   Latitude: North 40-42-46.10 Longitude: West 074-06-11.68
4. New Jersey State Plane Coordinates NAD 83 datum, US survey feet units, to nearest foot:
   North 684819 East 602106
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 10.72
   Elevation Top of Outer casing: 10.95 Elevation of ground: 8.65
   *Check one*: ☐ NAVD 88 ☒ NVGD29 ☐ On Site Datum ☐ Other
6. Source of elevation datum (benchmark, number/description and elevation/datum). If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation (referencing NAVD 88).
   NGS Bench Mark KV0272. Elevation = 36.37' (NGVD29). (Subtract 1.14' to convert elevation to NAVD88 datum)
7. Significant observations and notes:

## SECTION D. LAND SURVEYOR'S CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

# WELL PERMIT

%%:activity_class_well%%

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

%%:activity_class_well%%

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

# WELL PERMIT

| DEVIATION INFORMATION | |
|---|---|
| Purpose: | |
| Unusual Conditions: | |
| Reason for Deviation: | |
| Proposed Well Construction | |

| GENERAL CONDITIONS/REQUIREMENTS |
|---|
| A copy of this permit shall be kept at the worksite / on the property and shall be exhibited upon request. [N.J.A.C. 7:9D-1] |
| A well record must be submitted by the well driller to the Bureau of Water Systems and Well Permitting. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the well record shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Record: within ninety (90) days after the well is completed.[N.J.A.C. 7:9D-1] |
| All well drilling/pump installation activities shall comply with N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| For this permit to remain valid, the well approved in this permit shall be constructed within one year of the effective date of the permit. [N.J.A.C. 7:9D-1] |
| If the pump capacity applied for is less than 70 gpm, no subsequent increase to 70 gpm or more shall be made without prior approval of the Bureau of Water Systems and Well Permitting. [N.J.A.C. 7:9D-1] |
| If the use of the well is to be changed a well permit for the proposed use of the well shall be submitted for review and approval. [N.J.A.C. 7:9D-1] |
| If you or a future property owner intend to redesignate this well as a Category 1 well (domestic, non-public, community water supply or public non-community water supply wells), the well must be constructed as a Category 1 well per the Well Construction and Abandonment Regulations at N.J.A.C. 7:0D-1.1 et seq. In addition, if the current or future property owner intends to have this well redesignated as a community water supply well, the well must be constructed by a Master well driller, which would include having a Master well driller on-site at all times during construction of the well, as specified in the Well Construction and Abandonment Regulations. Otherwise, the New Jersey Department of Environmental Protection will not allow the well to be redesignated, and a new well would have to be installed. [N.J.A.C. 7:9D-1.7((a))1i] |
| In accepting this permit the Property Owner and Driller agree to abide by the following terms and conditions [N.J.A.C. 7:9D-1] |
| In the event that this well is not constructed the well driller shall notify the Bureau of Water Systems and Well Permitting of the permit cancellation. Unless prior written approval is obtained from the Bureau of Water Systems and Well Permitting the Cancellation notification shall be submitted electronically through the New Jersey Department of Environmental Protection's Regulatory Services Portal Submit Well Permit Cancellation : by the expiration date of this permit.[N.J.A.C. 7:9D-1] |
| In the event this well is abandoned, the Owner or Well driller shall assume full responsibility for having the well decommissioned in a manner satisfactory to the New Jersey Department of Environmental Protection in accordance with the provisions of N.J.A.C. 7:9D-1 et seq. [N.J.A.C. 7:9D-1] |
| The granting of this permit shall not be construed in any way to affect the title or ownership of property, and shall not make the New Jersey Department of Environmental Protection or the State a party in any suit or question of ownership of property. [N.J.A.C. 7:9D-1] |
| The issuance of this permit shall not be deemed to affect in any way action by the New Jersey Department of Environmental Protection on any future application. [N.J.A.C. 7:9D-1] |
| This permit conveys no rights, either expressed, or implied to divert water. [N.J.A.C. 7:9D-1] |
| This permit does not waive the obtaining of Federal or other State or local Government consent when necessary. This permit is not valid and no work shall be undertaken until such time as all other required approvals and permits have been obtained. [N.J.A.C. 7:9D-1] |
| This permit is NONTRANSFERABLE [N.J.A.C. 7:9D] |
| This well shall not be used for the supply of potable / drinking water. [N.J.A.C. 7:9D-1] |

Grouting Method: Pressure method (Tremie Pipe) Drilling Method: Hollow Stem Augers

**ADDITIONAL INFORMATION**

Protective Casing: Yes
Static Water Level: 2.1 ft. below land surface
Water Level Measure Tool: TAPE
Well Development Period: .5 hrs.
Method of Development: SUBMERSIBLE
Pump Type:

Pump Capacity: _ gpm
Total Design Head: _ ft.
Drilling Fluid:
Drill Rig: GUS PECH BRAT
Health and Safety Plan Submitted? Yes

**Date Stamp**
**(For Department use only)**

**SECTION A. SITE NAME AND LOCATION**

Site Name: Study Area SA-6 South Chromium Remedy

List all AKAs: Roosevelt Bowling Lanes (Site 124)

Street Address: 427 Route 440

Municipality: Jersey City (Township, Borough or City)

County: Hudson Zip Code: 07305

Program Interest (PI) Number(s): G000008741 Case Tracking Number(s):

**SECTION B. WELL OWNER AND LOCATION**

1. Name of Well Owner Bayfront Redevelopment, LLC
2. Well Location (Street Address) 427 Rt. 440
3. Well Location (Municipal Block and Lot) Block# 24601 Lot # 8

**SECTION C. WELL LOCATION SPECIFICS**

1. Well Permit Number (This number must be permanently affixed to the well casing): E201506364
2. Site Well Number (As shown on application or plans): 124-PZ-11
3. Geographic Coordinate NAD 83 to nearest 1/100 of a second:
   Latitude: North 40-42-39.93 Longitude: West 074-05-56.34
4. New Jersey State Plane Coordinates NAD 83 datum, US survey feet units, to nearest foot:
   North 684200 East 603290
5. Elevation of Top of Inner Casing (cap off) at reference mark (nearest 0.01'): 9.69'
   Elevation Top of Outer casing: 10.00' Elevation of ground: 9.81'
   *Check one*: ☐ NAVD 88 ☒ NGVD 29 ☐ On Site Datum ☐ Other
6. Source of elevation datum (benchmark, number/description and elevation/datum). If an on-site datum is used, identify here, assume datum of 100', and give approximated actual elevation (referencing NAVD 88).
   NGS Bench Mark KV0272. Elevation = 36.37' (NGVD29). (Subtract 1.14' to convert elevation to NAVD88 datum)
7. Significant observations and notes:

**SECTION D. LAND SURVEYOR'S CERTIFICATION**

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment.

- SITE BOUNDARY

NOTES:

1. BORING LOCATIONS AND MONITORING WELL LOCATIONS SURVEYED BY KELLER AND KIRKPATRICK , JULY 2005. HORIZONTAL DATUM NAD 1983.
2. **BOLD** VALUES INDICATE THAT DETECTED CONCENTRATION EXCEEDS THE NJDEP GWQS OF 70 ug/L FOR TOTAL CHROMIUM.
