# APPENDIX J

# ITEMS ENCOUNTERED DURING REMEDIAL ACTIVITIES

# APPENDIX J-1
# ARSENIC-IMPACTED ASPHALT DEBRIS IN SOIL

During excavation activities at SA-6 South numerous subsurface features, conditions, or structures were encountered. Additional details regarding activities related to those conditions are included below.

**Concrete Reuse**

On December 20, 2013, Honeywell submitted a Certificate of Authority to Operate-Beneficial Use Determination (CAO-BUD) application to govern the onsite reuse of such concrete as initially directed by NJDEP. However, during subsequent conversations with NJDEP, Honeywell and NJDEP jointly concluded that a CAO-BUD was not necessary since concrete encountered during excavations was handled under the following guidelines:

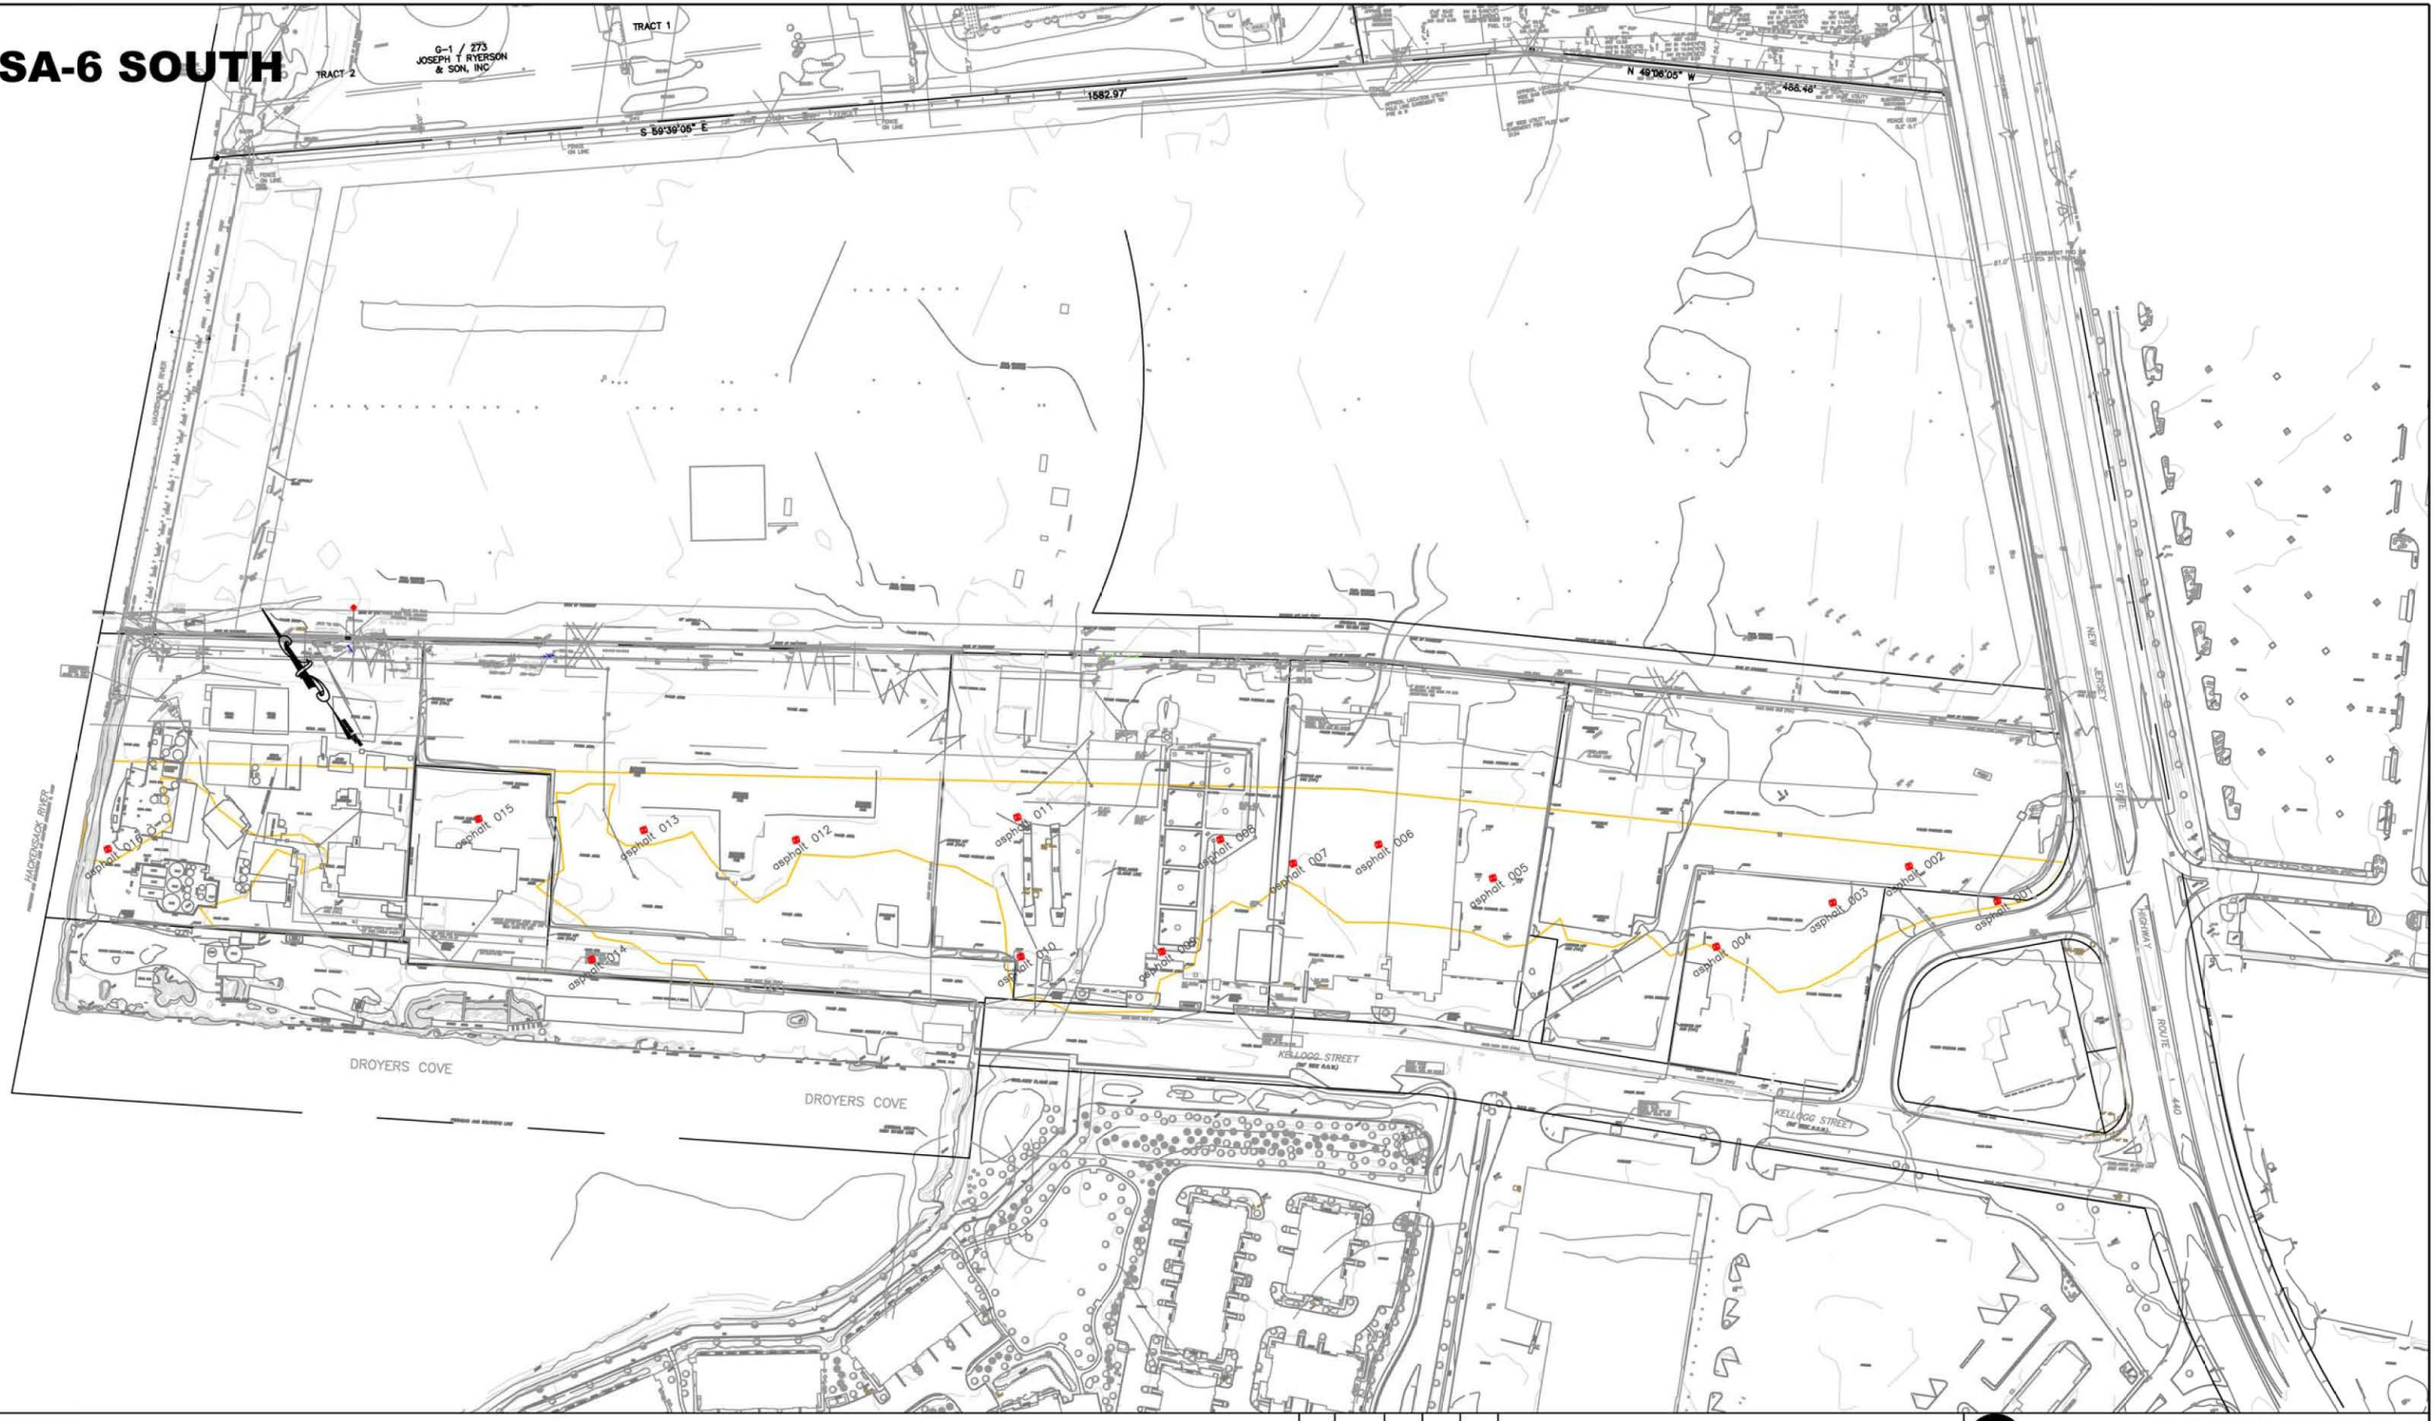
- The management of the reused concrete is governed by the NJDEP-approved SMP.
- The concrete was sampled and tested in accordance with the September 2013 CASP. Only concrete material that met the most stringent standards set forth in NJDEP's *Alternative and Clean Fill Guidance for SRP Sites* was considered for onsite re-use. In accordance with the NJDEP-approved SMP, if the material did not meet the reuse criteria, then it was transported offsite for disposal at an approved waste facility.
- Honeywell proposed reusing the concrete that met those standards as bridging lift for backfill in the onsite excavations. The concrete was then subsequently buried under additional fill material and is not exposed at the ground surface.

Therefore, on July 29, 2014 via electronic mail, Honeywell requested approval from NJDEP to rescind the December 20, 2013 CAO-BUD application. On September 30, 2014 NJDEP issued a letter approving Honeywell's request to rescind the CAO-BUD.

**Arsenic-impacted Asphalt**

As part of the SA-6 Chromium Remedy, Entact collected 16 samples (Asphalt-001 through Asphalt-016) of the existing asphalt pavement throughout the excavation footprint at SA-6 South in accordance with the September 2013 CASP as shown on the attached figure. The following summarizes the disposition of the arsenic-impacted asphalt encountered at SA-6 South:

- Minimum arsenic concentration for the six samples: 23.6 mg/kg;
- Maximum arsenic concentration for the six samples: 64.4 mg/kg; and



- Quantity of asphalt represented by the six samples: approximately 1,250 CYs or 2,100 tons.

On August 19, 2014, Honeywell submitted a letter via electronic mail to NJDEP requesting approval to consolidate the arsenic-impacted material within either the SA-6 North Open Space Area and/or SA-6 South Open Space AOC along with consolidated chromium-impacted soils. As required by the *Alternative and Clean Fill Guidance for SRP Sites* guidance document, Honeywell performed a "Like-on-Like" and "75th percentile analyses" on the historic fill soil sample results for the Open Space Areas at each Site. As explained in the August 19, 2014 letter, since conditions of the "75th percentile analyses" were not met, Honeywell sought a variance in accordance with Section 5.2 of the *Alternative and Clean Fill Guidance for SRP Sites* guidance document. Honeywell provided clarifying information on September 12, 2014 in response to verbal questions posed by NJDEP. Subsequently, in a September 15, 2014 letter to all Parties, Arnold and Porter clarified the proposal request to NJDEP in response to a September 9, 2014 letter from Plaintiffs. In response to Honeywell's written response and information subsequently provided, NJDEP sent an electronic mail to Honeywell approving of the proposed plan on October 15, 2014.

**Debris**

A larger volume than expected of debris was encountered comingled with soil in the eastern (Sites 124 and 125) and central (Site 134) portions of the SA-6 South excavation areas. The debris consisted of creosote-impacted piles from below buildings, concrete pieces, tires, sections of pipes, miscellaneous unrecognizable pieces of metal, general household items, etc. The debris co-mingled with soils that were being evaluated for reuse (i.e. soils previously classified as <20 mg/kg for hexavalent chromium) or those designated for consolidation in the Open Space AOC (i.e. soils previously classified as between 20 and 1,000 mg/kg for hexavalent chromium), posed a concern for jeopardizing the desired geotechnical properties of the re-compacted soil. Therefore, Entact mechanically separated the debris from soils designated for reuse or consolidation using the buckets of excavation equipment. The debris-free soil was then considered suitable for reuse or consolidation. The debris was disposed of offsite, totaling 315 tons. Entact did not separate debris comingled with soil already designated for offsite disposal. The soil co-mingled with the debris was loaded into trucks for offsite disposal.

# SA-6 SOUTH

NOTES:

Grab samples were collected randomly by breaking asphalt down to the soil interface.

**APPENDIX J-2**
**HYDROCARBON-IMPACTED SOIL**

**Hydrocarbon-Impacted Soil**

Initially based upon findings during the PDI borings, it was believed that a very limited quantity of hydrocarbon-impacted soil would be encountered primarily in the eastern part of the Site and that this limited quantity of hydrocarbon-impacted soil would be disposed of offsite. However, as the quantity of the hydrocarbon-impacted soil grew, it became apparent that alternatives to offsite disposal were necessary. Amec Foster Wheeler evaluated whether the hydrocarbon-impacted soils could be consolidated in the Open Space AOC along with other chromium-impacted soils that were <1,000 mg/kg for hexavalent chromium. Since the cap constructed over the Open Space AOC incorporates passive venting, Amec Foster Wheeler evaluated the inhalation risk associated with volatile organics and semi-volatile organic COCs in the hydrocarbon-impacted soil. This evaluation determined that any VOCs and naphthalene that were below their respective NJDEP inhalation-based residential standards would not pose an unacceptable inhalation risk or cause nuisance odors if the hydrocarbon-impacted soils were consolidated and capped in the Open Space AOC as approved by the NJDEP and indicated in DCB 012. Hydrocarbon-impacted soils that did not meet the NJDEP inhalation-based residential standards were shipped offsite for disposal.

The characterization sampling of the stockpiled hydrocarbon-impacted soils indicated that certain samples of this material exhibited selected metals and/or polynuclear aromatic hydrocarbons (PAHs) above the NJDEP Impact to Groundwater (IGW) standards. For such samples, representative portions of the stockpiles were subsequently re-sampled for Synthetic Precipitation Leaching Procedure (SPLP) analysis for the COCs above the IGW standards to evaluate the potential for the material to impact groundwater. In all such cases, the SPLP results were below the default leachate criteria for Class II groundwater. Two samples also exhibited select metals above NJDEP Residential Direct Contact Soil Remediation Standards (RDCSRS) and IGW standards. While these samples were tested for SPLP metals, not all of the SPLP default leachate criteria were met.

On August 25, 2014 via electronic mail, Honeywell requested approval from NJDEP to consolidate the remaining 24,000 CYs hydrocarbon-impacted material within the SA-6 South Open Space AOC along with other chromium-impacted soils that are <1,000 mg/kg for hexavalent chromium as long as the hydrocarbon-impacted soils meet the NJDEP inhalation-based residential standards. Honeywell's electronic mail included an August 20, 2014 memo prepared by Amec Foster Wheeler which, using the *Alternative and Clean Fill Guidance for SRP Sites* as a guide, outlined why this approach is consistent with the TRSR. Based upon a follow-up telephone conversation between Honeywell, NJDEP, and Amec Foster Wheeler on September 26, 2014, NJDEP sent an electronic mail to Honeywell

approving the proposed plan on October 2, 2014. Based upon the memo, supplemental information provided, and the September 26, 2014 conversation, NJDEP agreed that this approach is consistent with the TRSR for the following reasons:

- The Open Space AOC is completely contained with a hydraulic barrier and a cap.
- The contaminants and concentrations detected in the hydrocarbon-impacted soils are generally similar to those detected in the historic fill soils and are lower than the maximum values in the historic fill. Thus, the Like-on-Like requirement specified in the *Alternative and Clean Fill Guidance for SRP Sites* is satisfied.
- Extractable Petroleum Hydrocarbon (EPH) data were < 1,700 mg/kg; therefore, EPH was not a concern.
- Generally, the highest levels of PAHs in the hydrocarbon-impacted soils were associated with samples also with elevated naphthalene levels and those soils were disposed offsite.
- Generally, the contaminant concentrations in the hydrocarbon-impacted soils were lower than the maximum concentrations of COCs in the historic fill in the Open Space AOC.
- Only three samples of hydrocarbon-impacted soils exhibited selected metals above the RDCSRS.
- While some metals were detected above the IGW standards in the hydrocarbon-impacted soils, subsequent SPLP analysis for such metals were below the NJDEP Default Leachate Criteria with the exception of two samples for arsenic and one sample for antimony.
- Consolidating the hydrocarbon-impacted soils in the Open Space AOC expanded the remediated area in the Development AOC.
- Given the overall similarity of the hydrocarbon-impacted soils with the historic fill soils in the Open Space AOC, a 75$^{th}$ percentile analysis of the historic fill in the Open Space AOC as specified in the *Alternative and Clean Fill Guidance for SRP Sites* is not warranted.
- As requested by NJDEP, Honeywell agreed to direct Entact to consolidate the few portions of the hydrocarbon-impacted soils that contained PAHs and metals above the standards in the Open Space AOC in the vicinity of existing historic fill with similar COCs/concentrations.

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7:26D; last amended 5/7/2012].

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last amended November 2013]

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C.

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; las

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C.

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; las

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C.

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; las

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Prepared by: DP 05/24/2016

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C.

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; las

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Prepared by: DP 05/24/2016

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7:26D; last amended 5/7/2012].

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last amended November 2013]

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

B: Analyte found in sample and associated blank

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

B: Analyte found in sample and associated blank

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

B: Analyte found in sample and associated blank

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

B: Analyte found in sample and associated blank

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Prepared by: DP 04/04/2016

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last

NC: No criterion established

**Bold and underlined concentrations exceed the NJ2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

B: Analyte found in sample and associated blank

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

R or N: Rejected or negated by laboratory or data validator

U: Not detected above method detection limit

Results with a value of "0" indicates no TICs were detected

Prepared by: DP 04/04/2016

Notes:

NJ 2012 MOST STRINGENT SRS- NJDEP Most Stringent Soil Remediation Standards [N.J.A.C. 7:26D; last amended 5/7/2012].

NJ 2013 IGW SOIL – NJDEP Impact to Groundwater Soil Screening Levels [N.J.A.C. 7:26D; last amended November 2013]

NC: No criterion established

**Bold and underlined concentrations exceed the NJ 2012 MOST STRINGENT SRS**

**Bold and shaded concentrations exceed the NJ 2013 IGW SOIL or both the NJ 2013 IGW SOIL and the NJ 2012 MOST STRINGENT SRS**

*Italicized values not detected: reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

P: Pesticide/Aroclor analyte has greater than 25% difference between the two GC columns

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

PCBs: Polychlorinated Biphenyls

Criterion for total petroleum hydrocarbons based on 10,000 mg/kg cap value fo

**Bold and underlined concentrations exceed the Criteria**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

Prepared by: DP 04/04/2016

Notes:

RCRA Toxicity Characteristics (40 CFR261.24)

NC: No criterion established

**Bold and shaded concentrations exceed the RCRA Toxicity Characteristics (40 CFR261.24)**

*Italicized values not detected; reporting limit exceeds criteria*

Depths reported in feet below ground surface

CONC: Concentration reported in milligrams per kilogram (mg/kg)

J: Estimated concentration

Q: Data qualifier assigned by laboratory or data validator

U: Not detected above method detection limit

TCLP: Toxicity Characteristic Leaching Procedure

Prepared by: DP 04/04/2016

**Re: Groundwater Sampling Results**
**Study Area 6 (SA-6) South**
**Jersey City, New Jersey**

Dear Senator Torricelli:

In accordance with Section 4.0 of the October 2015 draft SA-6 Long Term Monitoring Plan (LTMP), Honeywell is providing the attached brief memorandum of groundwater sampling results prepared by Honeywell's engineering consultant, Amec Foster Wheeler. As we had indicated in our letter dated March 30, 2016, Amec Foster Wheeler implemented this initial round of post-remedial groundwater sampling in the Development AOC during the week of April 4, 2016. A description of the monitoring well installation, the groundwater sampling procedures, and the sample analytical results are provided in the attached memo.

Should you have any questions please contact the undersigned at (973) 455-2175.

Sincerely,

William J. Hague
Director, Remediation
Design and Constructionp

**Subject:** Summary of Post-Remedial Shallow Groundwater Sampling, First Quarterly Event SA-6 South, Sites 073, 124, 125, 134, 140 and 163

Amec Foster Wheeler E & I (Amec Foster Wheeler), on behalf of Honeywell, has prepared this memorandum to summarize the initial round of post-remedial shallow groundwater sampling activities and analytical results for samples collected in the Development area of concern (AOC) at SA-6 South (Sites 073, 124, 125, 134, 140, and 163) (the Site).

## Introduction

Groundwater sampling is being conducted to evaluate the effectiveness of recently completed remediation of hexavalent chromium (Cr(VI)) impacted soils at the Site pursuant to the draft Long Term Monitoring Plan (LTMP) submitted to all Parties on October 9, 2015. As proposed in the LTMP, quarterly sampling will continue for one year, at which time Honeywell will evaluate the need for continued quarterly monitoring. Depending on the results of the monitoring of any four consecutive quarters, Honeywell may propose a revision to the frequency of monitoring, subject to review and approval by NJDEP, the SA 6 South Consent Decree parties and the Special Master.

The attached **Figure 1**, revised from the Development AOC Shallow Groundwater Monitoring Plan (SGWMP) included as Appendix D of the SA-6 South 100% Design Report, shows all twelve well designations and locations. Well designations are also listed below:

- 073-MW-06;
- 073-MW-07;
- 073-MW-08;

200 American Metro Blvd
Suite 113
Hamilton, NJ 08619
609-689-2829
amecfw.com

- 124-MW-12;
- 124-MW-13;
- 125-MW-02;
- 125-MW-03;
- 134-MW-03;
- 134-MW-04;
- 140-MW-09;
- 140-MW-10; and
- 163-MW-02R

Eleven of the twelve wells were recently installed in February 2016[1]. The first quarter of sampling was conducted on April 6, 7, and 8, 2016.

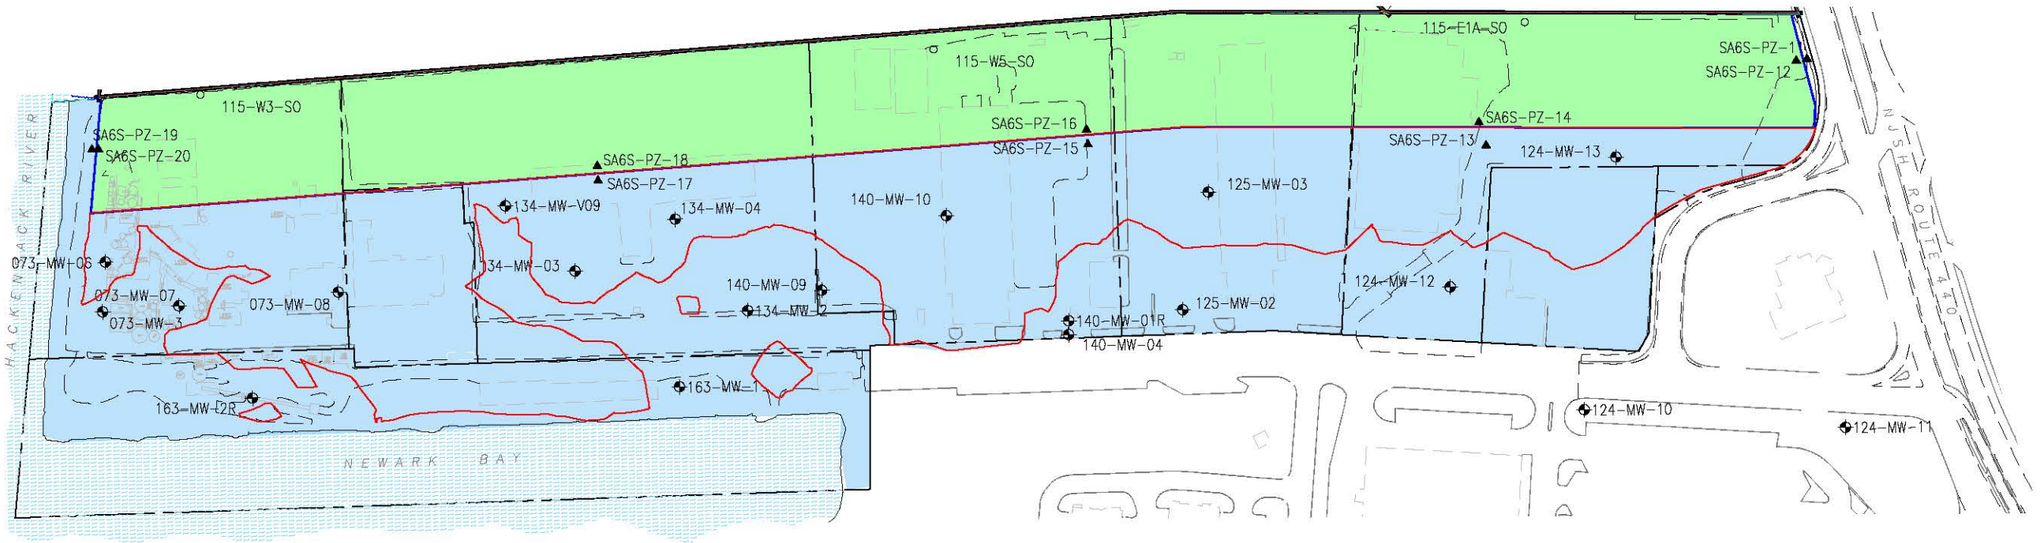
### Drilling and Groundwater Sampling Procedures

Amec Foster Wheeler's drilling subcontractor, B&B Drilling, mobilized a rotary drill rig to the Site to perform the drilling and install the post-remediation monitoring wells between February 10 and February 23, 2016. Hollow-stem augers were used to advance borings into the subsurface to the target drilling depths. Subsequently, 2-inch diameter, Schedule 40 polyvinyl chloride (PVC), pipe was lowered into the interior of the annulus, to construct the wells. Wells were installed as deep as 20 feet below grade and consist of a screened intervals (0.010" slot size) and solid riser pipe. A sand/gravel filter pack was installed in the borehole annular space and the boring was restored to grade with a cement grout. Constructed wells were then developed utilizing surging and pumping techniques. Monitoring well installation and development work was completed consistent with the NJDEP's "Well Construction and Maintenance, Sealing of Abandoned Wells Rules" (N.J.A.C. 7:9D; NJDEP, 2007) by a New Jersey Licensed driller (B&B Drilling). The post-remediation groundwater monitoring well installation documentation records will be included in the forthcoming final Remedial Action Report.

Prior to sampling, a round of synoptic groundwater level measurements was taken from all wells within the Development AOC. After the synoptic round, samples were collected via low-flow purging/sampling protocols per the NJDEP Field Sampling Procedures Manual and the Data Validation Report (Appendix H of SA-6 North 100% Design Report). Submersible pumps were utilized to extract the water from the wells and all non-dedicated/disposable sampling equipment was decontaminated before and after sampling of each well. Field parameters, including

[1] 163-MW-02R was an existing well installed on September 16, 2011 as a replacement for a previous monitoring well installed in a non-chromium AOC and retained after remediation for post-construction monitoring at Site 163.

temperature, specific conductivity, pH, dissolved oxygen (DO), salinity, turbidity and oxidation-reduction potential (ORP), were measured using a multiparameter water quality meter (Horiba U-52) and recorded during purging. Groundwater Sampling Forms summarizing the field sampling parameters will be provided in the forthcoming final Remedial Action Report.



Once purging was completed, laboratory-provided sample containers with appropriate preservatives were filled. Additionally, a portion of the water obtained from the wells was also field-filtered and placed in sample containers. Once filled, all containers were placed in coolers with ice. The samples were transported to Accutest Laboratories, Inc. of Dayton, New Jersey for analysis under chain of custody. Samples were analyzed for total and hexavalent chromium using USEPA Methods SW846 200.7 and SW846 7199, respectively, in accordance with the SGWMP. Additional analyses included field pH, which was measured in accordance with N.J.A.C 7:18, Subchapter 8, in a portion of the unfiltered water, and oxidation reduction potential.

### Groundwater Sample Analysis and Results

The analytical results for the unfiltered and filtered samples are summarized on the attached **Table 1**. Hexavalent chromium was either at or below the laboratory reporting limit of 5.5 µg/L at all locations, for both unfiltered and filtered samples. Total chromium concentrations in the unfiltered samples were below the NJDEP Groundwater Quality Standard (GWQS) of 70 µg/L at all but two of the twelve locations, with concentrations of 139 µg/L in 134-MW-04 and the highest observed concentration of 216 µg/L in 140-MW-09. However, the filtered data indicates that none of the samples contained total chromium above this standard, with the highest reported concentration being 62 µg/L in 140-MW-09.

**Re: Groundwater Sampling Results**
**Study Area 6 (SA-6) South**
**Jersey City, New Jersey**

Dear Senator Torricelli:

In accordance with Section 4.0 of the October 2015 draft SA-6 Long Term Monitoring Plan (LTMP), Honeywell is providing the attached brief memorandum of groundwater sampling results prepared by Honeywell's engineering consultant, Amec Foster Wheeler. Monitoring well installation and the initial round of post-remedial groundwater sampling in the Development AOC was presented in a memo dated May 16, 2016. Amec Foster Wheeler implemented the second quarterly round of post-remedial groundwater sampling in the Development AOC during the week of July 4, 2016. The groundwater sampling procedures and the sample analytical results for this second round are provided in the attached memo.

Should you have any questions please contact the undersigned at (973) 455-2175.

Sincerely,

William J. Hague
Director, Remediation
Design and Construction

**Subject:** Summary of Post-Remedial Shallow Groundwater Sampling, Second Quarterly Event SA-6 South, Sites 073, 124, 125, 134, 140 and 163

Amec Foster Wheeler E & I (Amec Foster Wheeler), on behalf of Honeywell, has prepared this memorandum to summarize the second round of post-remedial shallow groundwater sampling activities and analytical results for samples collected in the Development area of concern (AOC) at SA-6 South (Sites 073, 124, 125, 134, 140, and 163) (the Site).

## Introduction

Groundwater sampling is being conducted to evaluate the effectiveness of recently completed remediation of hexavalent chromium (Cr(VI)) impacted soils at the Site pursuant to the draft Long Term Monitoring Plan (LTMP) submitted to all Parties on October 9, 2015.

The attached **Figure 1**, revised from the Development AOC Shallow Groundwater Monitoring Plan (SGWMP) included as Appendix D of the SA-6 South 100% Design Report, shows all twelve well designations and locations. Well designations are also listed below:

- 073-MW-06;
- 073-MW-07;
- 073-MW-08;
- 124-MW-12;
- 124-MW-13;
- 125-MW-02;
- 125-MW-03;
- 134-MW-03;

200 American Metro Blvd
Suite 113
Hamilton, NJ 08619
609-689-2829
amecfw.com

- 134-MW-04;
- 140-MW-09;
- 140-MW-10; and
- 163-MW-02R

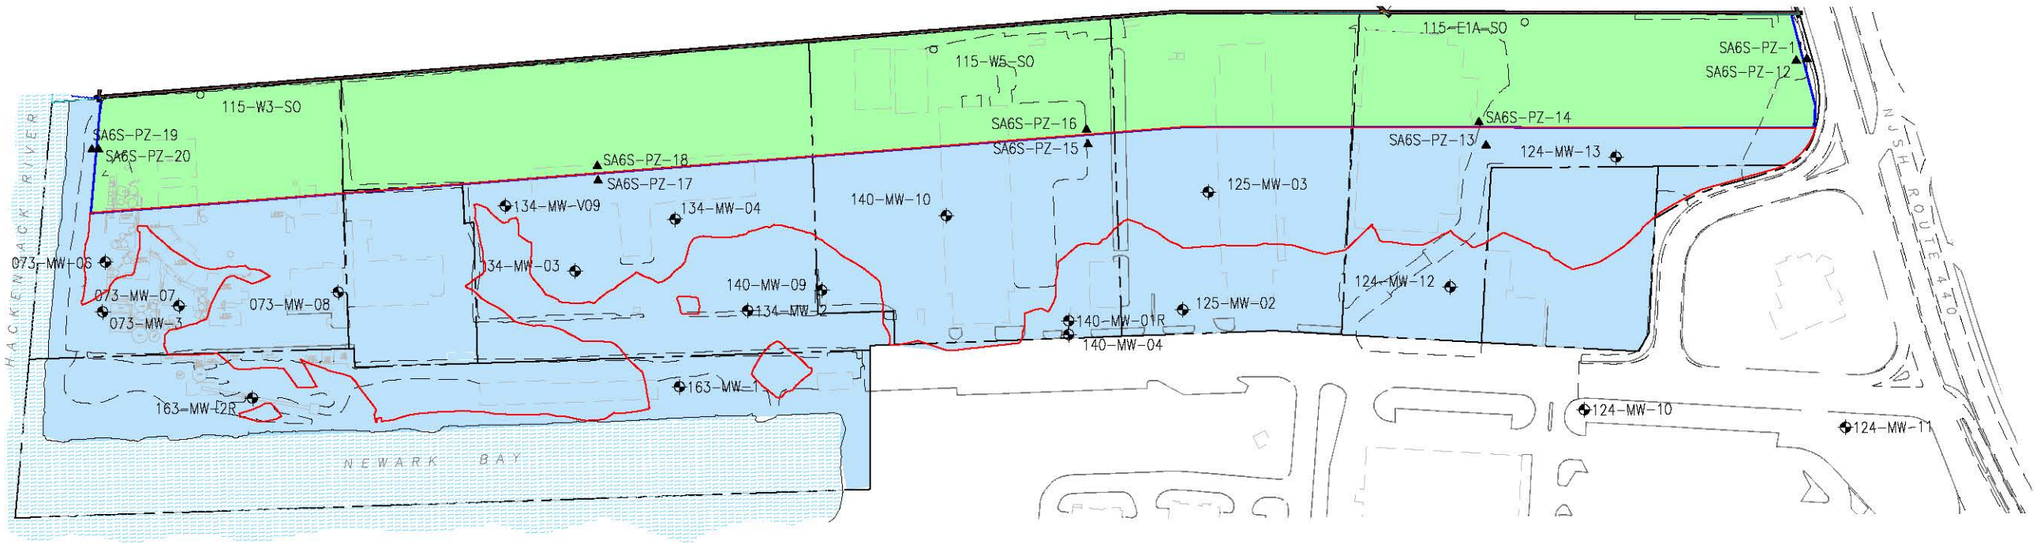
Eleven of the twelve wells were installed in February 2016[1] with the first quarter of sampling conducted in April 2016. The well installation and first quarter event are described in further detail within Amec Foster Wheeler's May 16, 2016 memo entitled *Summary of Post-Remedial Shallow Groundwater Sampling, First Quarterly Event*. The second quarterly sampling event was conducted on July 5, 6, and 7, 2016 and is detailed herein.

## Groundwater Sampling Procedures

Prior to sampling, a round of synoptic groundwater level measurements was taken from all wells within the Development AOC. After the synoptic round, samples were collected via low-flow purging/sampling protocols per the NJDEP Field Sampling Procedures Manual and the Data Validation Report (Appendix H of SA-6 North 100% Design Report). Submersible pumps were utilized to extract the water from the wells and all non-dedicated/disposable sampling equipment was decontaminated before and after sampling of each well. Field parameters, including temperature, specific conductivity, pH, dissolved oxygen (DO), salinity, turbidity and oxidation-reduction potential (ORP), were measured using a multiparameter water quality meter (Horiba U-52) and recorded during purging. Groundwater Sampling Forms summarizing the field sampling parameters will be provided in the forthcoming final Remedial Action Report.

Once purging was completed, laboratory-provided sample containers with appropriate preservatives were filled. Additionally, a portion of the water obtained from the wells was also field-filtered and placed in sample containers. Once filled, all containers were placed in coolers with ice. The samples were transported to Accutest Laboratories, Inc. of Dayton, New Jersey for analysis under chain of custody. Samples were analyzed for total and hexavalent chromium using USEPA Methods SW846 200.7 and SW846 7199, respectively, in accordance with the SGWMP. Additional analyses included field pH, which was measured in accordance with N.J.A.C 7:18, Subchapter 8, in a portion of the unfiltered water, and oxidation reduction potential.

## Groundwater Sample Analysis and Results



The analytical results for the unfiltered and filtered samples are summarized on the attached **Table 1**. Hexavalent chromium was not detected at any of the locations, for both unfiltered and

[1] 163-MW-02R was an existing well installed on September 16, 2011 as a replacement for a previous monitoring well installed in a non-chromium AOC and retained after remediation for post-construction monitoring at Site 163.

filtered samples.  Total chromium concentrations exceeded the NJDEP Groundwater Quality Standard (GWQS) of 70 µg/L at only two of the twelve locations, with concentrations of 145 µg/L (unfiltered) and 123 µg/L (filtered) in 140-MW-09 and 71.3 µg/L (unfiltered) in 125-MW-03.

The Honorable Robert G. Torricelli
Office of the Special Master
*RGTSpecialMaster@aol.com*

**Re: Initiation of Long Term Groundwater Monitoring**
**Study Area 6 (SA-6) South**
**Jersey City, New Jersey**

Dear Senator Torricelli:

In accordance with the September 1, 2016 Revised Draft SA-6 Long Term Monitoring Plan (LTMP) and the Groundwater Level Monitoring Plan (GWLMP) which was Appendix J of the SA-6 North Chromium Remedy 100% Design Report, Honeywell is hereby providing notice to the Parties that we will initiate long-term groundwater monitoring activities at SA-6 South the week of November 14, 2016. While Honeywell acknowledges the LTMP has not been approved as final by the parties, Honeywell will act to meet the requirements of the current draft to move site activities forward. Since the Chromium Remedy at SA-6 South was substantially complete when the geomembrane liner was installed in October 2015, the 12-month "transition period" for groundwater specified in the LTMP and GWLMP ended in October 2016. We have authorized our environmental consultants, Amec Foster Wheeler and Cornerstone, to implement the following general activities at SA-6 South:

- Install data loggers in piezometers,
- Conduct manual water level gauging, and
- Implement quarterly groundwater sampling of the twelve specified monitoring wells in the Development AOC.

Similarly for SA-6 North, we are monitoring the groundwater level recovery following completion of excavation and geomembrane liner installation, and anticipate that the "transition period" will be complete in Spring 2017. At that time, we will initiate long-term monitoring at SA-6 North. The Spring 2017 monitoring will include the inspections associated with the cap vegetation.

In response to Plaintiffs' request to establish baseline groundwater quality conditions inside the Open Space Areas, Amec Foster Wheeler collected filtered and unfiltered groundwater samples from each piezometer on the interior of both Sites. The samples were analyzed for total and hexavalent chromium. A summary of this data is provided in the attached Table 1. The location of the piezometers is shown on the attached Figure 1.

Should the Parties wish to discuss this further, we will be prepared to discuss at the next All Parties meeting on November 15th. Should you have any questions in the meantime, please contact the undersigned at (973) 455-2175.

Sincerely,

William J. Hague
Global Director, Remediation
Design and Construction

**Re: Groundwater Sampling Results**
**Study Area 6 (SA-6) South**
**Jersey City, New Jersey**

Dear Senator Torricelli:

In accordance with Section 4.0 of the September 2016 Revised Draft SA-6 Long Term Monitoring Plan (LTMP), Honeywell is providing the attached brief memorandum of groundwater sampling results prepared by Honeywell's engineering consultant, Amec Foster Wheeler. Monitoring well installation and the first two rounds of post-remedial groundwater sampling in the Development AOC were presented in memos dated May 16, 2016 and September 1, 2016. Amec Foster Wheeler implemented the third quarterly round of post-remedial groundwater sampling in the Development AOC during the week of October 3, 2016. The groundwater sampling procedures and the sample analytical results for this third round are provided in the attached memo. As mentioned in my email to All Parties on October 13, 2016, Amec Foster Wheeler also filtered the sample from two of the monitoring wells through a smaller filter size (0.1 micron) in addition to the standard filter size (0.45 micron). The objective of the extra filtering was to evaluate whether trivalent chromium detected in the monitoring wells during the previous sampling event is complexing on colloidal particles smaller than the standard 0.45 micron filters.

The analytical data provided in the attached Amec Foster Wheeler memo indicates that the post-remedy groundwater conditions at the SA-6 South Development AOC are now below NJDEP standards in all filtered samples. As indicated in Honeywell's October 13, 2016 email, the presence of total chromium in filtered groundwater samples may be related to trivalent chromium in soils complexing on small particles. The analytical data for the samples filtered through the 0.1 micron filter supports this conclusion. Further, we do not believe that COPR is the source of the total chromium. Instead, we note that the 140-MW-09 well is located within an area of historic fill, thus differences between total chromium and hexavalent chromium may be associated, at least in part, with non-COPR sources of chromium such as historic fill or other historical industries in this part of the site.

Should you have any questions please contact the undersigned at (973) 455-2175.

Sincerely,

William J. Hague
Global Director, Remediation
Design and Construction

# Memo

**Date:** November 30, 2016

**From:** Joe Clifford/Dennis Nagg – Amec Foster Wheeler

**To:** Bill Hague – Honeywell

**cc:** John Morris, Maria Kaouris, John Mojka – Honeywell
Jeremy Karpatkin, Michael Daneker – Arnold & Porter

**Subject:** Summary of Post-Remedial Shallow Groundwater Sampling, Third Quarterly Event SA-6 South, Sites 073, 124, 125, 134, 140 and 163

Amec Foster Wheeler E & I (Amec Foster Wheeler), on behalf of Honeywell, has prepared this memorandum to summarize the third round of post-remedial shallow groundwater sampling activities and analytical results for samples collected in the Development area of concern (AOC) at SA-6 South (Sites 073, 124, 125, 134, 140, and 163) (the Site).

## Introduction

Groundwater sampling is being conducted to evaluate the effectiveness of recently completed remediation of hexavalent chromium (Cr(VI)) impacted soils at the Site pursuant to the Revised Draft Long Term Monitoring Plan (LTMP) submitted to all Parties on September 1, 2016.

The attached **Figure 1**, revised from the Development AOC Shallow Groundwater Monitoring Plan (SGWMP) included as Appendix D of the SA-6 South 100% Design Report, shows all twelve well designations and locations. Well designations are also listed below:

- 073-MW-06;
- 073-MW-07;
- 073-MW-08;
- 124-MW-12;
- 124-MW-13;
- 125-MW-02;
- 125-MW-03;
- 134-MW-03;
- 134-MW-04;

200 American Metro Blvd
Suite 113
Hamilton, NJ 08619
609-689-2829
amecfw.com

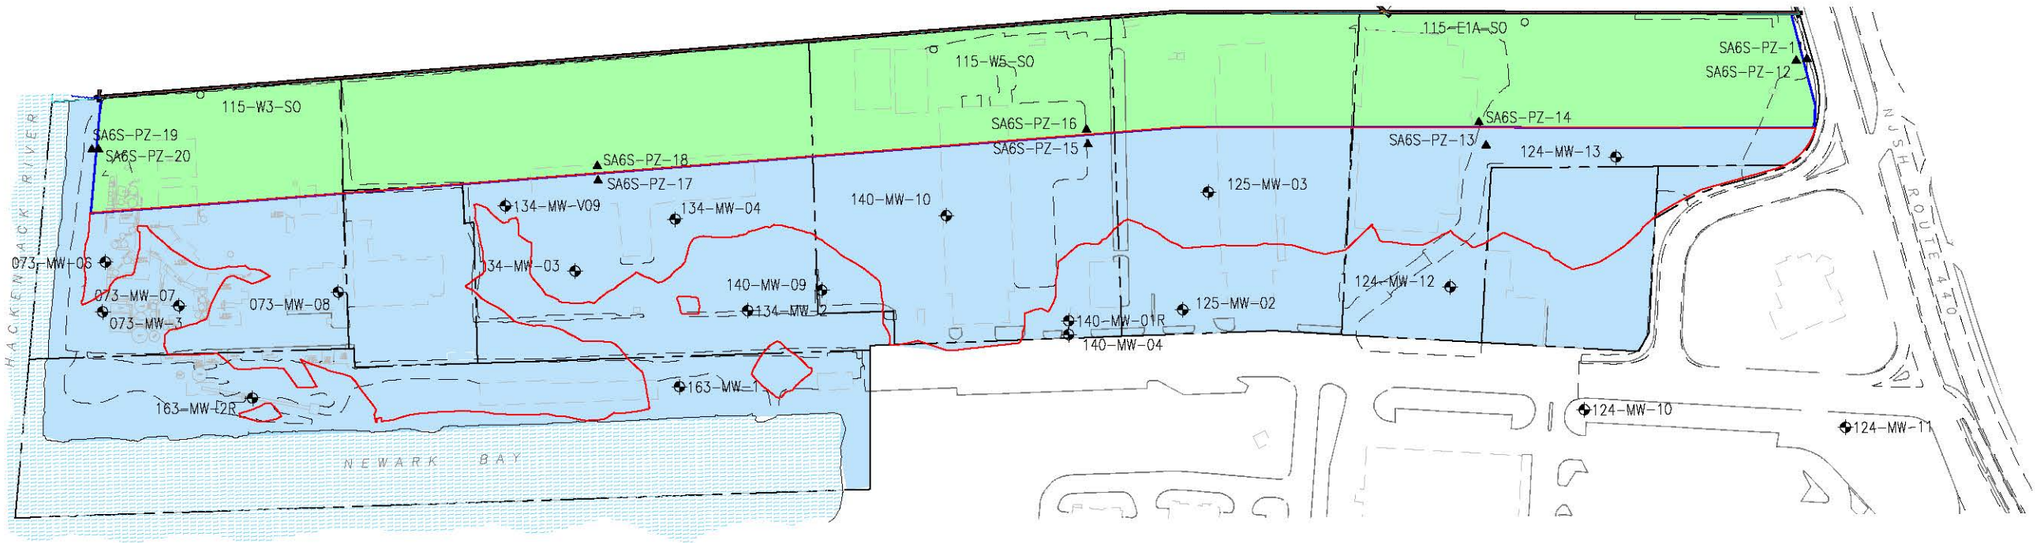
- 140-MW-09;
- 140-MW-10; and
- 163-MW-02R

Eleven of the twelve wells were installed in February 2016[1] with the first quarter sampling conducted in April 2016 and the second quarter sampling conducted in July 2016. The well installation and first quarter event are described in further detail within Amec Foster Wheeler's May 16, 2016 memo entitled *Summary of Post-Remedial Shallow Groundwater Sampling, First Quarterly Event* and the second quarter event is summarized in Amec Foster Wheeler's September 1, 2016 memo entitled *Summary of Post-Remedial Shallow Groundwater Sampling, Second Quarterly Event*. The third quarterly sampling event was conducted on October 4, 5, and 6, 2016 and is detailed herein.

## Groundwater Sampling Procedures

Prior to sampling, a round of synoptic groundwater level measurements was taken from all wells within the Development AOC. After the synoptic round, samples were collected via low-flow purging/sampling protocols per the NJDEP Field Sampling Procedures Manual and the Data Validation Report (Appendix H of SA-6 North 100% Design Report). Submersible pumps were utilized to extract the water from the wells and all non-dedicated/disposable sampling equipment was decontaminated before and after sampling of each well. Field parameters, including temperature, specific conductivity, pH, dissolved oxygen (DO), salinity, turbidity and oxidation-reduction potential (ORP), were measured using a multiparameter water quality meter (Horiba U-52) and recorded during purging. Groundwater Sampling Forms summarizing the field sampling parameters will be provided in the forthcoming final Remedial Action Report.

Once purging was completed, laboratory-provided sample containers with appropriate preservatives were filled. Additionally, a portion of the water obtained from the wells was also field-filtered, utilizing a 0.45 micron (µ) filter for all wells. For wells 125-MW-03 and 140-MW-09, samples were also filtered through a 0.1 µ filter in addition to the 0.45 µ filter to evaluate whether trivalent chromium is complexing on particles smaller than the standard 0.45 micron filters. After filtering, the samples were placed in sample containers. Once filled, all containers were placed in coolers with ice and samples were transported to Accutest Laboratories, Inc. of Dayton, New Jersey for analysis under chain of custody. Samples were analyzed for total and hexavalent chromium using USEPA Methods SW846 200.7 and SW846 7199, respectively, in accordance with the SGWMP. Additional analyses included field pH, which was measured in accordance with N.J.A.C 7:18, Subchapter 8, in a portion of the unfiltered water, and oxidation reduction potential.



[1] 163-MW-02R was an existing well installed on September 16, 2011 as a replacement for a previous monitoring well installed in a non-chromium AOC and retained after remediation for post-construction monitoring at Site 163.

## Groundwater Sample Analysis and Results

The analytical results for the unfiltered and filtered samples are summarized on the attached **Table 1**. Hexavalent chromium was detected at low levels at only one location, 140-MW-10, with concentrations of 0.011 mg/L and 0.0099 mg/L for unfiltered and filtered samples, respectively. Total chromium concentrations exceeded the NJDEP Groundwater Quality Standard (GWQS) of 70 µg/L at only one of the twelve locations, with concentrations of 184 µg/L (unfiltered) and 134 µg/L (filtered w/ 0.45 µ filter) in 140-MW-09. However the total chromium for this well when sampled through the 0. 1 µ filter was 61.6 ug/L. An email from Honeywell to all Parties, dated October 13, 2016 provided additional explanation of the 140-MW-09 data.

**APPENDIX J-4**
**SITE 073 DEFERRED AREA SAMPLING**

## Site 073 Deferred Area Sampling

The additional soil borings conducted to further investigate hexavalent chromium-impacted soils in the Site 073 deferred area are described in the Sections below. The samples were analyzed for hexavalent chromium as summarized in **Table 6C.**

### Phase I Borings

The Phase I borings were drilled with a hollow stem auger rig. Boring 073-SB-101 was drilled to a depth of 19 feet bgs to evaluate soil conditions below the concrete slab. Boring 073-SB-102 was drilled to a depth of 9 feet bgs to confirm shallow soil observations in boring 073-SB-101 south of the Site 073 20 mg/kg delineation line. The 5-foot thick concrete slab was encountered at boring 073-SB-101, but there was a band of soils containing COPR at 2 to 2.8 feet bgs, sandwiched between a concrete slab above and below at this location. A 3-foot thick concrete slab was observed at boring 073-SB-102, but COPR was not observed in soils underlying the slab to the end of the boring. Thus, samples collected from boring 073-SB-101 were analyzed for hexavalent chromium, but those collected from boring 073-SB-102 were not. The samples confirm conditions in the deferred area based upon RI and PDI sample results.

### Phase II Borings

The Phase II borings were drilled with a Geoprobe® rig. To assess soils as close as possible to the bulkhead, the borings were drilled on a 20º angle (from vertical) starting from a point located as far west as possible given the access constraints of the asphalt/concrete berm located along the river's edge in this area (see Photo 271). The NJ-licensed driller determined that 20º was the maximum angle at which the rig could operate and still advance the tooling/sampling equipment into the ground. Each boring was drilled 24 feet along the drilling axis. At the 20º angle, each boring was completed approximately 7 feet horizontally (west and closer to the bulkhead) of its starting position. By selecting a starting position as close as possible to the berm and angling the borings, samples were collected from soils farther west and closer to the bulkhead than had been collected previously in vertical borings (073-SB-067 through 073-SB-070) conducted during the PDI.

COPR was not observed in any of the Phase II borings. Based upon the analytical results from the previous PDI soil borings, soil samples from the Phase II borings were not collected from the 0 to 2 feet bgs interval. Instead, sampling started at 4 feet bgs and continued until 23 feet (measured along the drilling axis) was reached. Hexavalent chromium concentrations in soils collected from the Phase II angled borings were similar to those from the PDI vertical borings (073-SB-067 through 073-SB-070) in this area.

# APPENDIX J-5
# "ANOMALOUS" MATERIAL SAMPLING

**"Anomalous" Material Sampling**

Additional details regarding activities related to the so-called "anomalous" or "suspect" material observed during excavation activities are described below.

"Anomalous" material was visually identified as potentially chromium-impacted soil at several locations in the excavation sidewall at the previously delineated horizontal extent of the >20 mg/kg hexavalent chromium impacted soils. At such locations, Amec Foster Wheeler collected a sample of the visually-impacted material.

Three locations in the Kellogg Street Development AOC where the "anomalous" material was visually identified included the following locations are as shown on **Figure 11**:

- The southern excavation sidewall on Site 125 behind the 60 Kellogg Street building (Honeywell and Amec Foster Wheeler facility offices); and
- Two locations on the southern excavation sidewall on Site 140.

Post-excavation sidewall samples (125-SB-306, 140-SB-107, and 140-SB-108) were collected at these three locations. Amec Foster Wheeler submitted the post-excavation sidewall samples to Accutest for analysis for hexavalent chromium. **Table 6B** shows that the hexavalent chromium results were <20 mg/kg; therefore, no additional excavation or sampling was required for these three locations.

Another location in the Kellogg Street Development AOC where potentially chromium-impacted soil was observed was in the sidewall and bottom of the western portion of the excavation at Site 134 as shown on **Figure 12**. This portion of the excavation had been following the surface of the Stratum D. The visually anomalous material was a thin lens observed just above the Stratum D. Three samples, 134-SB-160, 134-SB-161, and 134-SB-162, were collected and analyzed by Accutest for hexavalent chromium in the sidewalls of this area as excavation advanced to the west, but each was >20 mg/kg for hexavalent chromium. Additional excavation was conducted to the west to remove the visible material, but eventually Honeywell and Amec Foster Wheeler decided to halt further excavation until the chromium-impacted material (>20 mg/kg for hexavalent chromium) could be delineated. Consequently, supplemental delineation borings, 134-SB-164 through 134-SB-175, were installed west of this initially identified anomaly at the locations shown on **Figure 12**.

The soil borings were conducted using a hollow stem auger drill rig provided by B&B Drilling. Each boring was logged by a representative of Amec Foster Wheeler and the logs

are provided in **Appendix H**. Soil samples were collected from the soil borings at generally the same elevation as the initially identified visual anomalous material and samples 134-SB-160, 134-SB-161, and 134-SB-162, and were analyzed by Accutest for hexavalent chromium.

As seen on **Table 6A**, hexavalent chromium in several samples collected from this area were >20 mg/kg. Thus, step-out soil borings were continued until this area was delineated to <20 mg/kg for hexavalent chromium. Once the limits were established, the excavation was expanded to those limits, and delineation samples that were <20 mg/kg for hexavalent chromium became the final sidewall samples. The southern extent of the expanded excavation area was not accessible for a soil boring due to an adjacent soil stockpile at the time delineation drilling was occurring. The stockpile was moved after the drill rig was demobilized and the excavation commenced to expand this anomalous area, so a post-excavation sidewall sample, 134-SB-177 was collected once the excavation was expanded to the south and this location was visually checked and confirmed that there was no visibly anomalous material in this area.

The material was handled similar to other SA-6 South excavated materials, in that it was segregated based upon its designation (A, B, C, or D) according to hexavalent chromium concentrations.

During excavation at Site 073 in the Kellogg Street Development AOC, a potentially chromium-impacted 1-foot thick concrete slab was observed lying immediately below the ground surface at approximately 1 to 2 feet bgs at the location shown on **Figure 13**. The stained side of the concrete slab was in contact with underlying soils. The stained concrete was broken up and removed for subsequent offsite disposal with D Material. Two post-excavation sidewall samples (073-SB-079 and 073-SB-080) were then collected from approximately 3 feet deep from the soils underlying the stained concrete and analyzed for hexavalent chromium. The hexavalent chromium results are shown on **Table 6B** and indicate that soils underlying the stained concrete at sample location 073-SB-079 were not chromium-impacted (<20 mg/kg for hexavalent chromium) and those at 073-SB-080 were chromium-impacted (>20 mg/kg for hexavalent chromium). Therefore, step-out soil borings were conducted with a Geoprobe® drill rig east of the 073-SB-080 sidewall sample location to 3.25 feet bgs. A soil sample collected from approximately 3 feet deep at the furthest step-out soil boring, 073-SB-082, was analyzed for hexavalent chromium. The results confirmed that soil at the 073-SB-082 location was not chromium-impacted (<20 mg/kg for hexavalent chromium). Thus, the excavation was expanded to the east approximately 4 feet to the 073-SB-082 soil boring sample location as shown on **Figure 13.**

**Suspect Material at Site 125 under 60 Kellogg Street Building Slab**

The suspect material observed in shallow soils within the 60 Kellogg Street building footprint during the demolition activities on April 29, 2016 was investigated and excavated. Initially, the excavation was completed to approximately 10 feet by 10 feet in size in accordance with the approach identified in the May 17, 2016 submittal. The bottom and sides of the excavation at the final limits were visually inspected by Amec personnel. Whitish discoloration was observed in several sidewall locations. The excavation was subsequently extended to approximately 14 feet by 14 feet to remove additional soil until no further discolorations were observed. The depth of excavation varied from approximately 2.9 feet to 4.2 feet bgs.

Once the final limits were reached and the whitish material observed in the sidewalls was determined, based upon previous observances and analysis of samples of such material, to most likely be un-impacted material, one post-excavation soil samples were collected from each sidewall and one post-excavation soil sample from the bottom of the excavation. This sampling frequency meets the approved frequencies established in the SA-6 South 100% Design Report.

**GENERAL CONTRACTOR : Entach Corp**

**CERTIFICATION:** Clean Fill Certification

**PROJECT: Honeywell Jersey City NJ.**

Please accept this letter as our certification that the Clean Fill to be supplied to you through EME for the above referenced project is produced at our Plumsted Township Plant located at 849 Route 539, New Egypt, NJ 08533. Block 80 lot 4.

The material provided from our pit is:
Excavated from undisturbed geologic formations;
Obtained from a licensed quarry/mine;
Not been subject to a discharged hazardous substance at any time;
Not located on or impacted by other contaminant sources;
Not comingled with any other materials;
Not known or suspected of being contaminated.
Not adversely impacted by discharges of hazardous materials or chemical applications;
Not affected by conditions or processes that would result in the introduction of contaminates into the licensed quarry/mine material in concentrations above regulatory concern; and
Not affected by conditions or processes that would increase the concentrations of contaminants already present in the licensed quarry/mine to concentrations above regulatory concern.
Also please find a copy of our state mine registration.

If you need any further assistance, please feel free to contact me.

Sincerely,

Keith Prince

Reference: Virgin Rock Certification

To Whom It May Concern,

Liberty Aggregates certifies that the aggregate (11/2" DGA and 3/4" clean) to be purchased for the Honeywell project in Jersey City, New Jersey are produced from clean, virgin rock excavated from the Mayrich project located at 524-530 East 74th Street, New York, New York. The depth of this excavation is approximately 50 feet and contains over 90,000 yards of material. This material is free from any contaminants and is stockpiled at our facility located at 34 Caven Point Avenue, Jersey City, New Jersey.

CERTIFICATION

"Celgene Soil" - New Source of Imported Clean Fill

In 2014, Honeywell identified a new source for backfill material to be used at SA-6 during the chromium remedy. The material was from a nearby construction site at the Celgene facility. The material was not from a quarry, but rather from a virgin portion of the Celgene property where a new underground structure and parking garage was being constructed. It was tested for environmental impacts and for geotechnical properties and was found to meet the NJDEP and the SA-6 100% Design requirements for use as clean fill at SA-6. Honeywell prepared correspondence entitled, "New Source of Imported Clean Fill," dated July 3, 2014 which was submitted to all the Parties. Given the above, the "Celgene Soil" is suitable for unrestricted use at SA-6.

ENVIRON

July 12, 2012

MEMORANDUM

To: William J. Hague, P.E., Honeywell

From: Jose Sananes, P.E., ENVIRON
Gary DiPippo, P.E., Cornerstone
Mark Nielsen, P.E., ENVIRON

Subject: SA7 Contractor Submittal #15C - Earth Material Testing Report

ENVIRON and Cornerstone have reviewed Sevenson Environmental Services' (SES) submittal #15C (Earth Material Testing Report) for compliance with the project specifications. The testing report is applicable to all sand and stone materials to be used for the remedy construction at SA7. The materials will originate from Tilcon's Mount Hope Quarry.

As required in **Specification 35 43 00**, "cap materials shall not be obtained from an industrial site or from a source suspected to have been modified by the addition of man-made chemicals. For each source, material type prior to acceptance and for each 5,000 cubic yards, Contractor shall provide analytical data to indicate that the material is free from contamination, the total chromium concentration is below 370 mg/kg and the hexavalent chromium concentration is below 20 mg/kg, and a certificate of Clean Fill as per NJDEP requirements (N.J.A.C. 7:26E-6), unless other material is approved by the consent of the Parties" (i.e., the Special Master). Note that subsequent to the revision to the 100% Design Report we informed Sevenson that we are requiring a 1 mg/kg limit on hexavalent chromium.

In accordance with the NJDEP's Fill guidance (August 2011), SES has submitted a certification stating that the materials originate from a virgin source of rock not located on or impacted by any contaminated sources (see attached TILCON mining certificate and a certification prepared by S&S Environmental dated June 8, 2012). In addition, SES has provided analytical results for the materials (attached). Based on the information provided, we find the material to be acceptable, although we noted the following:

1. Beryllium was detected at a concentration of 0.549 ppm, which marginally exceeds the New Jersey impact-to-groundwater (IGW) soil screening level of 0.5 ppm. However,

    a. As per the NJDEP IGWSRS guideline and FAQs (http://www.nj.gov/dep/srp/guidance/rs/igw_faq.pdf), if detected concentrations are demonstrated to be due to background conditions as opposed to discharges, then no remediation is required (i.e., there is no AOC). As indicated above, SES has provided a certification from the quarry stating that the materials are not impacted by any contaminant source.

b. The detected concentration of beryllium is consistent with NJDEP's published median concentration for the urban piedmont region where the materials will be placed. Although the beryllium concentration is higher than the median concentration reported for rural areas of the New Jersey ridge and valley province where the quarry is located, the detected concentration is lower than the 90th percentile concentration (see NJDEP report on background: http://www.nj.gov/dep/dsr/research/ambient-levels-metal.pdf).

- NJ Urban Piedmont:
  - median=0.51 mg/kg;
  - $90^{th}$ Percentile = 0.82 mg/kg
- NJ Ridge& Valley Province:
  - median = <0.01 mg/kg;
  - $90^{th}$ Percentile = 0.91 mg/kg

c. The published EPA method 6020 QA/QC for beryllium indicates that the percent recovery on spiked samples is 75% to 125%. Given this range, the slightly elevated result in comparison to the default IGW soil screening level is within the level of accuracy of the analysis.

d. The IGW soil screening levels which are based on protection of potable drinking water are not necessarily applicable to this project. The sediment cap material is being placed in the Hackensack River (a saline surface water body) where there would be no potential for impact to potable water. If we consider the saline water quality criterion as the more appropriate end point, then the adjusted clean fill "IGW" soil screening level would be 21 mg/kg (i.e., a factor of 42 when changing from a groundwater quality criterion of1 ug/L to a saline surface water quality criterion of 42 ug/L) assuming all other factors remain the same.

e. The NJ Clean Fill Policy specifies that clean fill proposed for use at a site cannot impact sediment quality in a way that is "inconsistent with the proposed remedial action. In other words, the proposed remedial action for the receiving AOC must address all sediment issues whether from the existing contamination or the placement of the clean fill." In this regard, we note that the beryllium concentration in the quarry material is the approximately the same as the mean sediment concentration reported in the SA7 sediment investigation report (ENVIRON 2006).

2. Aluminum and Manganese concentrations in the quarry sample also exceeded the IGW soil screening levels, however, the NJDEP has determined that the IGW pathway does not need to be addressed for these contaminants unless there is cause to believe that their presence is due to a site discharge. As indicated above, SES has provided a certification from the quarry stating that the materials are not impacted by any contaminant source.

3. The quality of the materials will continue to be verified through the required testing every 5,000 CY.

# 1.0 Filtering Criteria Design

**Filter Design Calculations**
**April 28, 2012 - Donegan**
**Jersey City SA7**
**Revised 6.28.12**

| Aggregate Specification/Type | D15 (in) | D50 (in) | D85 (in) | Proposed Layer |
|---|---|---|---|---|
| Insitu Material 1 - "coarse" | | | 0.0163 | Insitu Material 1 |
| Insitu Material 2 - "Fine" | | | 0.0025 | Insitu Material 2 |
| Grits Mount Hope Quarry (Sand) | 0.010 | 0.055 | 0.118 | Proposed "Sand Layer" |
| ASTM 5 (0.75" Armor) | 0.551 | 0.768 | 0.906 | Proposed 0.75" Material |
| ASTM 57 (Filter Layer) | 0.433 | 0.551 | 0.709 | Proposed Filter Layer |
| ASTM 4 (1.0" Armor) | 0.827 | 1.063 | 1.339 | Proposed 1" Material |
| ASTM1 (1.5", 1.6" and 2.0" Armor) | 1.673 | 2.638 | 3.287 | Proposed 1.5, 1.6, and 2.0" Material |
| 4's and 5's (3.5" Armor) | 2.953 | 3.543 | 5.118 | Proposed 3.5" Material |

**Filter Material Design Criteria**

Filter Criteria for Coarse Grained — D15 upper layer ≤ 5 x D85 lower layer
Filter Criteria for Fine Grained — D15 upper layer ≤ 9 x D85 lower layer

**Analysis of Sand and Armor Cap Materials Based Against and Permeability Criteria**

Note: Criteria results in red are outside of the acceptable range.

| Insitu Layer | | | | "Sand Material" | | | Filter Criteria |
|---|---|---|---|---|---|---|---|
| Type | | | D85(in) | Type | D15(in) | D50(in) | D15 armor / D85 sand |
| Insitu Material 1 - "coarse" | | | 0.0163 | Grits Mount Hope Quarry (Sand) | 0.010 | 0.055 | 0.605 |
| Insitu Material 2 - "Fine" | | | 0.0025 | Grits Mount Hope Quarry (Sand) | 0.010 | 0.055 | 3.900 |

| Sand Material | | | | Filter Layer | | | Filter Criteria |
|---|---|---|---|---|---|---|---|
| Type | D15(in) | D50(in) | D85(in) | Type | D15(in) | D50(in) | D15 armor / D85 sand |
| Grits Mount Hope Quarry (Sand) | 0.010 | 0.055 | 0.118 | ASTM 57 (Filter Layer) | 0.433 | 0.551 | 3.667 |

| Filter/Sand Layer | | | | Armor Cap | | | Filter Criteria |
|---|---|---|---|---|---|---|---|
| Type | D15(in) | D50(in) | D85(in) | Type | D15(in) | D50(in) | D15 armor / D85 sand |
| Grits Mount Hope Quarry (Sand) | 0.010 | 0.055 | 0.118 | ASTM 5 (0.75" Armor) | 0.551 | 0.768 | 4.667 |
| ASTM 57 (Filter Layer) | 0.433 | 0.551 | 0.709 | ASTM 4 (1.0" Armor) | 0.827 | 1.063 | 1.167 |
| ASTM 57 (Filter Layer) | 0.433 | 0.551 | 0.709 | ASTM1 (1.5", 1.6" and 2.0" Armor) | 1.673 | 2.638 | 2.361 |

# 2.0 Letter from Tilcon

TILCON

# TILCON NEW YORK INC.

625 MT. HOPE ROAD • WHARTON, NEW JERSEY 07885 • PHONE 973-366-7741

June 26, 2012

Mr. Timothy Donegan, PE
Engineering Manager
Sevenson Environmental Services, Inc.
815 Ritchie Highway, Suite 107
Severna Park, MD 21146

RE: Quarry Source and NJDEP Residential Direct Soil Remediation Standards/Clean Fill Criteria

Mr. Donegan,

As discussed today, June 26, 2012, the table below provides a summary of the materials we intend to provide for the Jersey City SA7 project and the source (quarry). A sample report is provided as an attachment for our Mount Hope Quarry identified in table 1 below.

**Table 1 – Material Source Identification**

| Tilcon Material Type | Sevenson Designation | Quarry Source |
|---|---|---|
| Grits | Sand | Mount Hope Quarry |
| ASTM 57 | Filterlayer | Mount Hope Quarry |
| ASTM 5 | 0.75 Inch Armor | Mount Hope Quarry |
| ASTM 4 | 1.0 Inch Armor | Mount Hope Quarry |
| ASTM 1 | 1.5, 1.6 AND 2.0 Inch Armor | Mount Hope Quarry |
| 4's and 5's | 3.5 Inch Armor | Mount Hope Quarry |
| Light Stone Filling | 6" Armor Stone | Mount Hope Quarry |
| Medium Stone Filling | 10" Armor Stone | Mount Hope Quarry |
| DGA | Roadway Stone | Mount Hope Quarry |

All of the materials will be supplied from the Mount Hope Quarry and are durable and quarried from virgin gneiss. The materials identified come from the same location in the quarry as provided in the environmental analysis attached. All of the materials detailed above meet the NJDEP Residential Direct Soil Remediation Standards/Clean Fill Criteria. Please let us know if you have any questions.

Sincerely,

William H. Aspinall, IV
VP New Jersey Operations

Attention: Mr. Steve O'Reilly

Re: Mount Hope Rock Quarry, New Jersey

Dear Mr. O'Reilly:

As requested, I visited the referenced quarry site on June 7, 2012. The purpose of my site visit was to visually check the area of the quarry where granite rock is being surface mined from an undisturbed geologic formation. The rock which is mined at this location is blasted, transported to the on-site crushing operation, and then processed into various sized aggregates including ¾ inch stone which is sold to various customers. The stone is virgin material, and no chemicals and/or additives are added to the product.

A Site Review was conducted in accordance with the New Jersey Department of Environmental Protection (NJDEP) Site Remediation Program Fill Guidance at SRP Sites dated August 11, 2011.

TILCON has owned and operated the rock quarry since 2001. The area of the quarry site was also used for mining iron, beginning around 1710, and the Mount Hope iron mines operated for over 250 years. The area of the quarry where virgin rock is being surface mined has never been used for any other industrial or commercial purposes.

Based on my site visit of June 7, 2012, information provided by Tilcon New York, Inc. (TILCON) with respect to their ownership and use of the site, and according to the preliminary investigation regarding site development and use history, the rock which is being obtained from this quarry has not been located on or impacted by any contaminant sources.

If there are any questions or should you require additional information, please do not hesitate to contact me.

Very truly yours,

S & S ENVIRONMENTAL SCIENCES, INC.

Yilmaz Arhan, Ph.D.
Vice President

|---|---|---|---|---|---|
| **Client:** | TILCON New York, Inc. | | | | |
| **Project:** | Mount Hope, New Jersey | | | | |
| **Subject:** | Laboratory Analysis of Stone Fines | | | | |
| **Job No.:** | 07-E-34 | **Report Number:** | 12-E-206 | **Date:** | 06-15-2012 |

We present herewith the laboratory test results of the stone fines sample picked up by a representative of our firm on June 8, 2012. The sample was collected by a representative of TILCON on June 8, 2012.

As requested, the sample was analyzed for the U.S. EPA Target Compound List (TCL)+30/Target Analyte List (TAL) parameters, Extractable Petroleum Hydrocarbons (EPH), pH, and Hexavalent Chromium. The analyses were performed by Integrated Analytical Laboratories, LLC (IAL) (NJDEP Lab ID No. 14751).

The test results are summarized in Table Nos. 1 through 4. A copy of the IAL sample chain-of-custody form and a copy of the preliminary faxed IAL laboratory summary report are attached.

Based on the laboratory data, the sample meets all of the NJDEP Residential Direct Contact Soil Remediation Standards/Clean Fill Criteria.

If there are any questions or if we can be of further assistance in this matter please call us.

Very truly yours,

S & S ENVIRONMENTAL SCIENCES, INC.

Yilmaz Arhan, Ph.D.
Vice President

# CHROMIUM SOIL CLEANUP CRITERIA

September 2008 Revised April 2010[1]

The Department did not develop soil remediation standards for trivalent or hexavalent chromium as part of its Remediation Standards rules at N.J.A.C. 7:26D. The Department was awaiting the release of the final report from the National Toxicology Program (NTP) study evaluating hexavalent chromium as an oral carcinogen prior to proposing soil remediation standards. The NTP report was released in August 2008. The Department is reviewing the report and will make a determination regarding the adoption of remediation standards for chromium. Until such time, the Department will continue to use the following soil cleanup criteria for trivalent and hexavalent chromium as guidance.

## Soil Cleanup Criteria for Chromium

| Residential (mg/kg) | | | | | | |
|---|---|---|---|---|---|---|
| **Contaminant** | **CAS No.** | **Ingestion-Dermal** | **Inhalation** | **Allergic Contact Dermatitis (ACD)** | **Soil PQL** | **Residential Criterion** |
| Trivalent Chromium | 16065-83-1 | 120,000 | NA | NA | 2 | 120,000 |
| Hexavalent Chromium | 18540-29-9 | 240 | 270 | Site-specific determination | 2 | 240 or ACD value whichever is lower |

| Non-Residential (mg/kg) | | | | | | |
|---|---|---|---|---|---|---|
| **Contaminant** | **CAS No.** | **Ingestion-Dermal** | **Inhalation** | **Allergic Contact Dermatitis** | **Soil PQL** | **Non-Residential Criterion** |
| Trivalent Chromium | 16065-83-1 | NA | NA | NA | 2 | Not Regulated |
| Hexavalent Chromium | 18540-29-9 | 6,100 | 20 | Site-specific determination | 2 | 20 |

NA = Standard not available

[1] This revision corrects the CAS numbers that were mistakenly used for trivalent and hexavalent chromium in the September 2008 version. The CAS numbers were inadvertently switched.

Impact to ground water soil remediation standards must be developed on a site-specific basis for chromium. For Class II ground water, the ground water quality standard is 70 ug/l measured as total chromium but assuming that it is all in the form of hexavalent chromium.

In addition to the cleanup criteria listed above, all remedial actions at sites that have hexavalent chromium must comply with Commissioner Jackson's memorandum dated February 8, 2007. A copy of this memorandum can be found on the Department web site at http://www.state.nj.us/dep/dsr/chromium/crmorlift200702.pdf

More information about the Department chromium work group and chromium research efforts are available on the NJDEP web site at http://www.state.nj.us/dep/dsr/chromium .

# 5 - Gradation Curves for Roadway Stone, Sand, Filter Material, and Armor Stone (Mount Hope Quarry)

Tilcon Inc confirms that Fine QP (3/4") available at Mt. Hope Quarry conforms to section 901 of the ***New Jersey Department of Transportation StandardSpecifications for Road and Bridge Construction.*** The material is defined as virgin Gneiss mined at Mt. Hope Quarry, 625 Mount Hope Road, Block 20001-Lot 6.01 Wharton Borough, Morris County NJ. The material is identified on the job with Tilcon delivery tickets.

The unit weights and voids are for process control and should be verified by the contractor before use.

***Notes:*** Maximum Dry Density (gravel corrected) for Weldon WC QP based on Sor Testing Laboratories Report No. 13-2027 dated 12/9/13. Sample collected from on site soils.
Maximum Dry Density for Weldon WC Screenings based on Sor Testing Laboratories Report No. 13-1877 dated 11/6/13.
Maximum Dry Density (gravel corrected) for Tilcon MH DGA based on Sor Testing Laboratories Report No. 13-1334 dated 8/7/13.
Maximum Dry Density for Weldon LH Screenings based on Vertical V Laboratory Report No. 12643 dated 9/29/14.
Re-used on site historical fill material (Type A) will not be tested for compaction per Specification Section 02315-3.13 A.2.b
Moisture content not to exceed 3% above optimum per Specification Section 02315-2.04C
Bottom of excavation elevation based on Maser survey data (Center Point elevations)
Sample ID BF-01-01 where:

BF = Backfill (At frequency of 1 test/2500 SF)
01 = Test Location (as noted on Backfill Compaction Location Figure)
01 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again
= Area subject to re-compaction

* *Initial field testing indicated compaction of greater then 95% (see attached Sor Testing Lab (STL) memo). Laboratory results for initially provided Weldon WC QP sample indicated a maximum dry density of 136.7 pcf. Using this density the compaction results are greater than the 95%. Laboratory tests on later deliveries indicated density results of 142.6 pcf. This range is typical of what can be expected for this type of source. The Engineer of Record (EOR) directed that the results be reported using the higher more conservative value and that the STL field test report verifying the higher passing results be attached to the final documentation. It is further noted that the Design Documents do not designate this area for compaction as Structural Fill per Specification Section 02315 Section 3.12, Structural Fill 95%; Non Structural Fill 90% Standard Proctor. The 95% value noted in this Table was implemented to provide for uniform compaction in areas slated for future development. It is the EOR's opinion that these two samples meet the 100% Design and project requirements.*

| Project: | Honeywell SA-6, Jersey City NJ | | |
| Subject: | In-Place Density Tests | | |
| Job No.: | 13-208 | Report No.: 13-1994 | Date: 12/3/13 |

At the request of the client, on November 22, 2013 a field technician from Sor Testing Laboratories, Inc. reported to the project site for the purpose of performing in-place density tests over previously compacted lifts of materials at locations indicated by the client's representative.

Using a nuclear density gauge, our technician performed two density tests at locations 01BF-2 and 02BF-2 per the client's instructions. The proctor value of 136.7 pcf at our optimum moisture content of 8.1% was also provided by the client.

Test results were 97.5% and 95.7% compaction.

Technician: J.C. Jean-Toussaint

Very truly yours,
