SGS ACCUTEST New Jersey

Section 9

## Metals Analysis

### QC Data Summaries

Includes the following where applicable:

- Instrument Runlogs
- Initial and Continuing Calibration Blanks
- Initial and Continuing Calibration Checks
- High and Low Check Standards
- Interfering Element Check Standards
- Method Blank Summaries
- Matrix Spike and Duplicate Summaries
- Blank Spike and Lab Control Sample Summaries
- Serial Dilution Summaries
- IDL and Linear Range Summaries

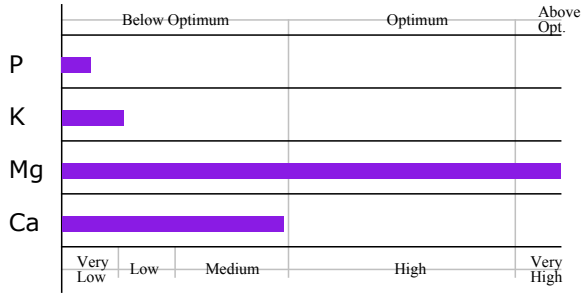
**Date Reported:** 2016-10-11

**Sample ID:** Woolston-TS-002

## Results and Interpretations

Sandy Loam



**pH:** 5.94 Moderately acidic; below optimum for many plants but tolerated by acid-loving species.

**Lime Requirement Index:** 7.72

The Lime Requirement Index (LRI) is a measure of the buffering capacity of the soil, its resistance to pH change, and is used to determine the appropriate amount of limestone, when necessary. LRI value near 8.0 indicates low buffering capacity of soil and a lower rate of limestone amendment compared to soil with high buffering capacity (LRI near 7.0).

## Macronutrients (pounds per acre)

| | | |
|---|---|---|
| **Phosphorus:** | 12 | (Below Optimum) |
| **Potassium:** | 42 | (Below Optimum) |
| **Magnesium:** | 520 | (Above Optimum) |
| **Calcium:** | 1397 | (Below Optimum) |

by Mehlich 3 extraction

## Micronutrients (parts per million)

| Zinc(Zn) | Copper(Cu) | Manganese(Mn) | Boron(B) | Iron(Fe) |
|---|---|---|---|---|
| 1.46 (Adequate) | 1.51 (Adequate) | 5.28 (Adequate) | 0.78 (Adequate) | 101.30 (High) |

## Special Tests Results

Soluble Salts- Electrical conductivity= 0.15 mmho/cm

(Satisfactory)

Organic Matter by Carbon Analysis: Organic Matter=5.7%

Very High for Sandy Loam

Gravel Content- Larger than 2mm: 4.3%

Mechanical Analysis- Sand= 73% Silt=13% Clay= 14% Texture: Sandy Loam

USDA sieve analysis of sand fraction:

**Subject:** Response to Email -- 101716 Horizon A Analytical Results 21319

Kim,

EME has confirmed that they needed to increase the % organic matter to meet our site specifications for Horizon A Topsoil. They confirmed that the organic additive used is Sphagnum Peat Moss.
A copy of the supplier's letter certifying that the Peat Moss is also a virgin source material is attached. The analytical and geotechnical data provided in our new Horizon A source data package was run on the actual blended soils with this Peat Moss added.

Per agreed upon protocols going back to the SA7 project implementation, Honeywell provides the full analytical data packages to all parties to demonstrate acceptability of each new source prior to beginning import. Subsequent sample data collected per the frequency identified in the specifications is provided at the end of the project in the final closeout documentation. Honeywell is continuing that process for SA6.

Please let us know if you have any further questions.

Thank you. -Joe

**Cc:** Hague, William [william.hague@honeywell.com] <william.hague@honeywell.com>; Egnaczyk, Steve <segnaczyk@louisberger.com>; Alicia Clark Alcorn <aalcorn@tpmlaw.com>
**Subject:** 101716 Horizon A Analytical Results 21319

Good afternoon Joe –

We have reviewed the New Source of Horizon A Topsoil data for EME and have one question. During the Technical All-Parties pre-call on October 4, you stated that the EME soil was mostly acceptable but might need some amendments with on-site material to meet the required % of organic matter as specified in the 100% design and DC 2014-09-17. The

clean fill certification states that the material has not been comingled with other materials. Please confirm that amending the material was not required or, provide additional information regarding the use of an amendment.

Also, please provide confirmation data for the Horizon A, B, and C soils used on site to date and going forward. Our records contain one set of data each for Horizon C and B dated October 26, 2015, and September 15, 2015, respectively. The data is to be collected on an on-going basis from every 5,000 cubic yards of material brought on-site.

Thank you –

Kim

**FINAL DCB 001 – SURCHARGE INSTRUMENTATION REVISION**

DESIGN CHANGE BULLETIN

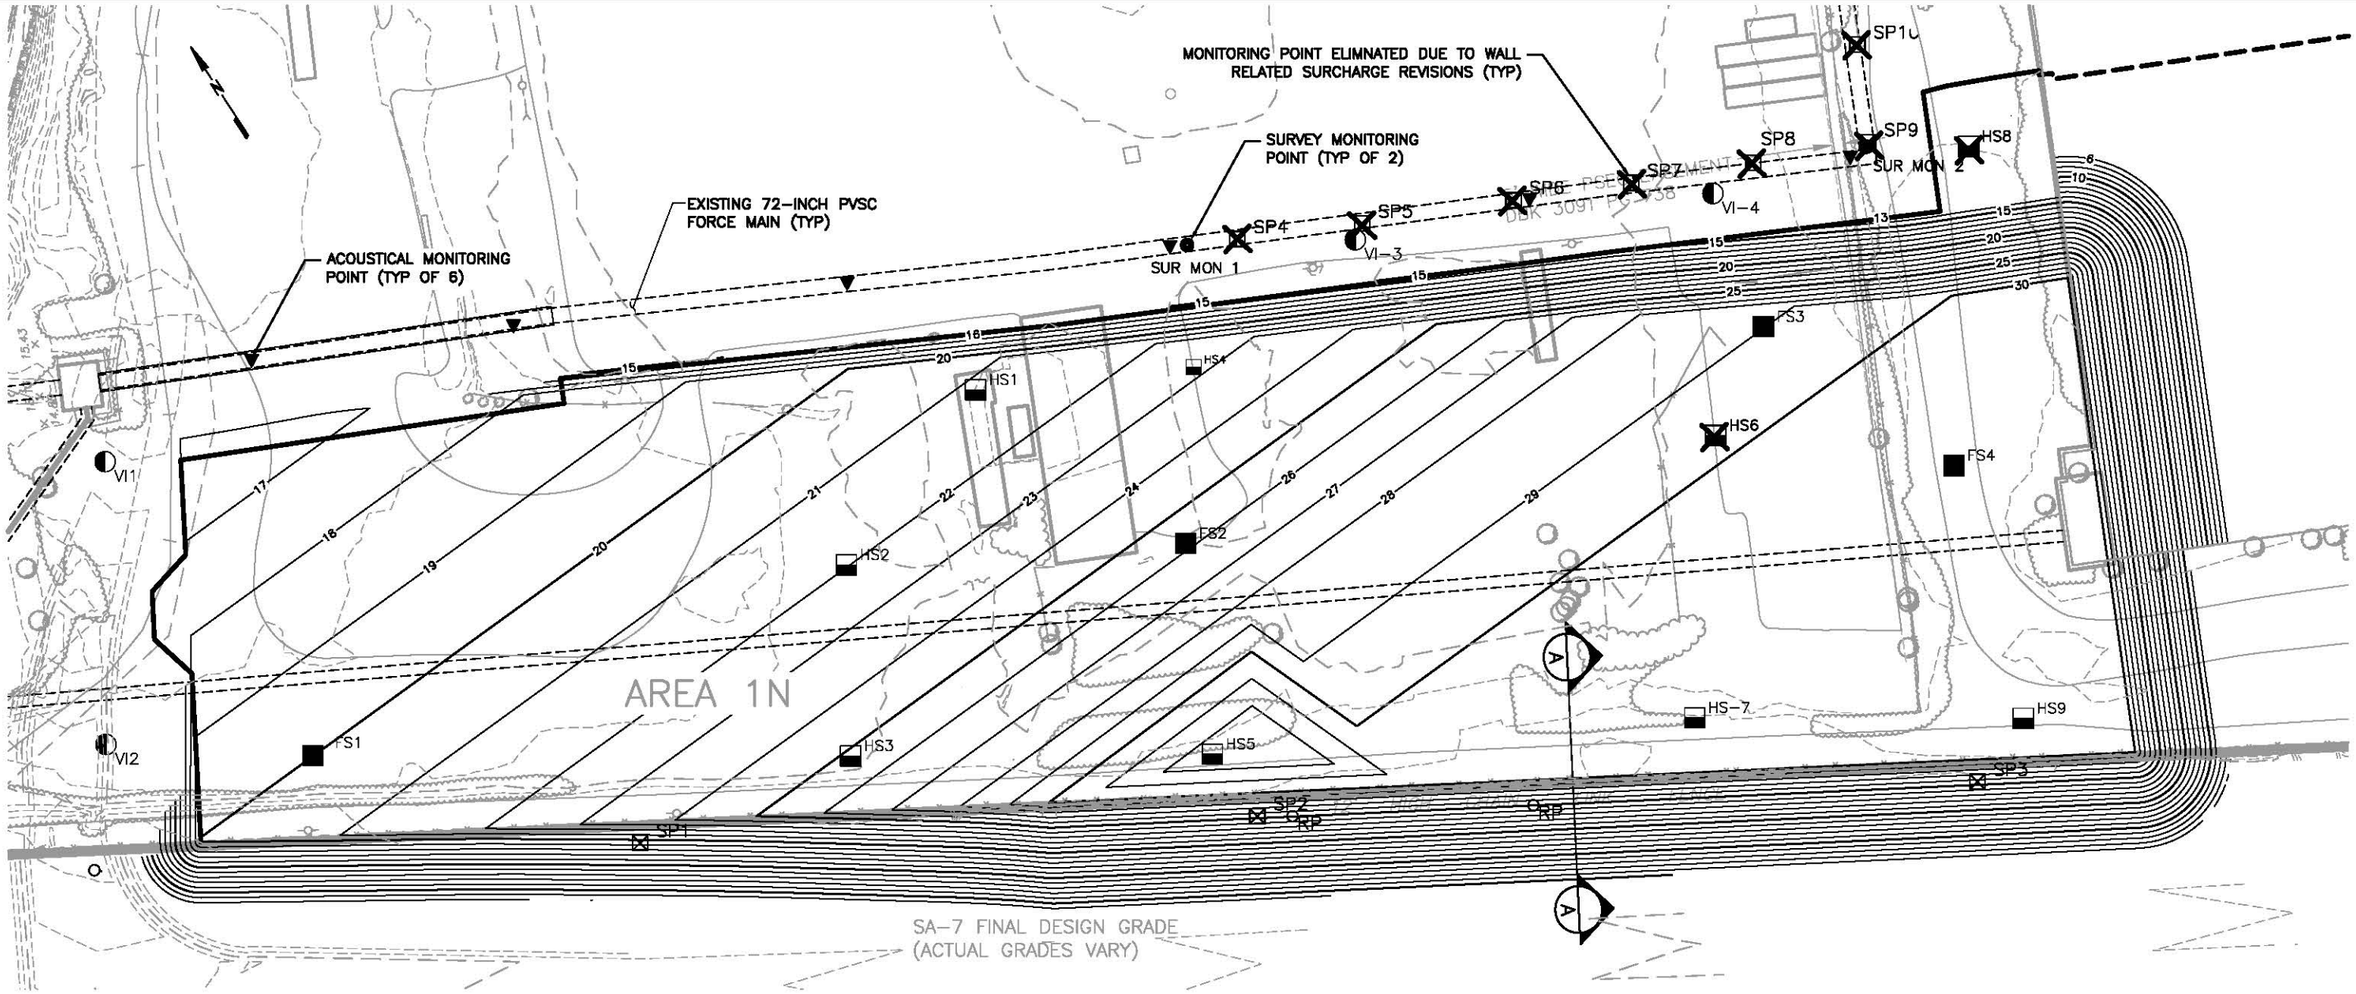
| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 001 Minor (a)<br>Effective Date: 2/26/14 |
| Project Location: SA-6 NORTH, SA6-SOUTH | Associated RFI: |
| Title: Surcharge Instrumentation Revision | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

Description of Change/Modification:

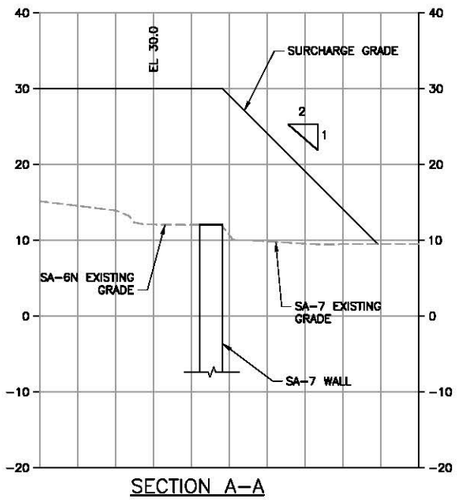
1. **72 inch force main**. The Surcharge Monitoring Plan (Appendix N of 100% Design Report) has been modified to match the changes in surcharge pile geometry associated with the relocation of the Hydraulic Barrier Wall near the 72" force main. The Barrier wall has been moved to a minimum distance of 25 feet from the centerline of the force main. The surcharge pile has also been reconfigured so that the surcharge will not result in any stress increase on the 72 inch force main. Details of changes to the Design Drawings stemming from the Barrier Wall Relocation are included in DCB-002. Details related to changes to the Surcharge Monitoring Instrumentation are included in this DCB 001.
2. **Station Relocations due to interferences.** In addition to the changes related to the 72 inch force main Amec has relocated some instrument location on both SA6 North and SA-6 South to avoid foundations and traffic routes. Relocated instruments are in the same general area and will serve the same objectives as the original locations.
3. **Form revisions.** Amec has modified several of the reporting forms to allow for direct entry using a tablet application. Templates for the Daily Report Form, Instrument Installation and Monitoring Data Forms are attached.

SUMMARY OF CHANGES

- SA-6 North Area 1 Figure B1
  - Half setups 6 and 8 have been removed due to the reduced footprint of the surcharge pile.
  - Settlement Platforms # 4-10 along the force main have been eliminated - no fill is being placed over the force main and therefore no settlement platforms are required.
  - Survey Points on the FM will be reduced from 3 to 2. Survey Points are no longer required; however, two points will be retained for background information (See Figure B1)
  - 6 Acoustical Sensors have been added along the JCMUA 72" force main. Acoustical Monitoring is not part of Honeywell/Amec's Scope. PVSC/HMM/Pure Technologies will conduct the Acoustical Monitoring. Pure Technology is monitoring the system remotely and will advise PVSC/HMM if there is any noise detected during sheetpile driving and surcharging activities that would be attributable to failure of the wire wrap. Any detected wire breaks will initiate actions per the PVSC Response Plan.
  - Inclinometers. Inclinometers are no longer required however they have been retained as a contingency monitoring measure. Due to the change in role of these instruments a trigger level will no longer be required.
  - Vibration Monitoring. Vibration Monitoring will be conducted during sheetpile driving. HMM concluded that the force main should be able to tolerate accelerations of up to 1.9 in/sec. Honeywell/PVSC have agreed to an Upper Limit of 1 inch/second to provide a Factor of Safety of approximately 2.
- Figures C1 and D1 for SA-6 North
  - Figures have been updated to only show the instrument locations in the specific Area. For example on the original issue Figure C1 included the instrument locations for Area 2 and also the instrument locations for Area 1 and Area 3. In this revision Fig. C1 only shows the Area 2 instrumentation locations.
  - Half setup locations in Figure D1 were relabeled.
- Figures F1, G1 and H1 for SA-6 South
  - Figures have been updated to only show the instrument locations in the specific Area (1-3).
  - Figures have been updated to show changes in instrument locations made to avoid foundations and traffic routes.



| Reason for Change/Modification: | Explanation or Reason: Modified due to changes in surcharge adjacent to the 72" force main |
|---|---|
| ☐ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | Attachments: ☑ Yes ☐ No<br><br>Cost Implication: ☐ Yes ☑ No<br>>$50k ☐ Yes ☑ No<br>Schedule Implication ☐ Yes ☑ No |
| Additional Comments: The Figures showing instrument locations have also be updated to reflect minor adjustments made in field to avoid conflicts with foundations and traffic routing.<br>Field forms contain the same information. The forms have been reformatted to allow for tablet data entry. | Design Documents Affected:<br>Appendix N: Surcharge Monitoring Plan |



| Honeywell (AP) Review: | | | |

# SETTLEMENT PLATFORM - FIELD DATA SHEET

| **Baseline Location** | |
|---|---|
| **Northing:** | |
| **Easting:** | |
| **Date/Recorded By:** | |

| **Baseline Elevations** | |
|---|---|
| **Existing Ground Surface Elev.[1,2] (ft):** | |
| **Initial Reference Clamp Elev.[1] (ft):** | |
| **Date/Recorded By:** | |

Survey the Reference Clamp Elevation
BEFORE and AFTER adding riser pipe!

| **Date** | **Recorded by** | **Settlement Platform** | **Fill Placement** | **Notes** |
|---|---|---|---|---|
| | | **Reference Clamp Elevation[1] (ft)** | **Ground Surface Elevation[1,3] (ft)** | **(note when riser pipe is added)** |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |
| | | | | |

Notes:

1. Measure/record elevations to the nearest 0.01 feet.
2. At installation, record existing ground surface elev. at/proximate to the installed platform; for determining fill thickness above existing grade.
3. During surcharge fill placement/monitoring period, record existing ground surface elev. (i.e., top of fill) at/proximate to the installed platform.

**FINAL DCB 003 – SA-6 GROUTED ANGLES**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 003 Minor (a)<br>Effective Date: 8/14/13 |
| Project Location: SA6-SOUTH<br>Title: SA-6S grouted angle Sta 0+00 to Sta 18+50 | Associated RFI:<br>☐ Yes, RFI No. ___ ☑ None |
| Contractor (Subcontractor): Entact / JD Fields | Project No.: 3480130377 |

Description of Change/Modification:

Beginning at Sta 0+00 and continuing to Sta18+50 on SA-6 South grouted angle is to be included on the back of the sheetpile wall. Groundwater sampling and analysis for pH has confirmed that the hydraulic barrier seal from Sta 0+00 to Sta 17+80 should be constructed using grouted joints. The design originally presented additional grouting as an option pending pH data from Sta 5+50 to 17+80. pH data has since confirmed that grouting is necessary to Sta 18+50. Drawing G-003, Note HB19 is to be revised to read:

NOTE HB19

"THE AREA INDICATED ON SHEETS S-201 TO S-203 FROM STATION 0+00 TO STATION ~~17+80~~ 18+50 WILL BE SEALED WITH A CEMENT BENTONITE GROUT IN LIEU OF HYDRAULIC SEALANT. THIS PORTION OF THE WALL WILL BE FABRICATED WITH A 2 ½" X 3/8" ANGLE AND ½" HDPE GROUT PIPE FROM THE TOP OF THE INTERLOCK TO THE DEPTH OF STRATUM D SOILS. SEE DRAWING S-203 DETAIL BF AND SPECIFICATION SECTION 02180 FOR ADDITIONAL INFORMATION."

| | |
|---|---|
| Reason for Change/Modification:<br>☑ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | Explanation or Reason: High pH groundwater conditions necessitate grout seal.<br>Attachments: ☑ Yes ☐ No<br>Cost Implication: ☑ Yes ☐ No<br>>$50k ☐ Yes ☐ No<br>Schedule Implication ☐ Yes ☑ No |
| Additional Comments:<br>• Cost impacts to be determined by Construction Manager<br>• Content has been conveyed to the contractor prior to formal issue of this DCB | Design Documents Affected:<br>Drawing G-003 Note HB19 |

(Name / Signature): Samuel G. Ebel Jr.

Does DCB Result in CCO? ☐ Yes (b) ☐No

Date: 5/2/14

Distribution:

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval
(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

**Memo**

| | | | |
|---|---|---|---|
| Date: | **8/12/2013** | cc: | **John Mojka, Honeywell**<br>**Maria Kaouris, Honeywell**<br>**Joe Clifford**<br>**Steve Mitchell**<br>**Dennis Nagg**<br>**Stu Bills** |
| From: | **Geoff Shallard** | | |
| To: | **Bill Hague, Honeywell** | | |
| Subject: | **Groundwater pH sampling** | | |

Amec collected groundwater pH readings from Study Area 6 North and South along the proposed hydraulic barrier wall alignment at 19 different locations as per the preapproved methodology. The locations and results are included in the attached figure.

Groundwater sampling screens were driven using direct push methodology to the desired depth of 12 feet below ground surface above Stratum D (aka meadow mat) which underlies the fill. From that depth, the outer casing of the drill rod was pulled back to expose a 2.5-foot long stainless steel screen. Utilizing a peristaltic pump, 3/8" poly tubing, and a multi-water quality checker, Horiba U-52, groundwater was purged from the screen and passed over the Horiba U-52 sensors in a flow through cell. Chemical parameters pH, turbidity, specific conductivity, temperature, ORP and DO were monitored and recorded in 5-minute intervals using the Low Flow Stabilization purging procedures as outlined in the New Jersey DEP Field Sampling Procedures Manual, 2005.

Calibration of the Horiba U-52 was performed onsite prior to sampling each day. The U-52 was calibrated for temperature, pH, specific conductivity, ORP, dissolved oxygen, and turbidity according to AMEC calibration Standard Operating Procedure which is based directly on the manufacturer's instructions.

Based on the groundwater pH sample results the hydraulic barriers between stations 0+00 and 5+00 at Study Area 6 North and between stations 0+00 and 18+50 at Study Area 6 South will be sealed with a cement grout as per Hydraulic Barrier Technical Requirements "HB19" in the Chromium Remedy 100% Design Drawings, dated June 2013.

Amec is certified with the NJDEP Office of Quality Assurance to perform field analysis of non-potable water for specific conductance, turbidity, dissolved oxygen, pH and temperature. The above mentioned field work was performed by Amec personnel.

GENERAL NOTES

GN1. COORDINATE USE OF SITE WITH HONEYWELL, THE ENGINEER, SITE OWNER, AND THE CURRENT TENANT ON THE SITE.

GN2. CONTRACTOR SHALL VISUALLY INSPECT THE SITE TO ASCERTAIN THE CONDITION IF EXISTING FEATURES AND FAMILIARIZE THEMSELVES WITH THE WORK.

GN3. THE CONTRACTOR SHALL BE RESPONSIBLE TO SECURE ALL NECESSARY PERMITS EXCEPT FOR SPECIFIED PERMITS SECURED BY HONEYWELL AND/OR THE SITE OWNER OR TENANT.

GN4. KNOWN UNDERGROUND UTILITIES AND STRUCTURES ARE SHOWN ON THE DRAWINGS. THE LOCATION OF THESE EXISTING UNDERGROUND UTILITIES AND STRUCTURES SHOULD BE CONSIDERED APPROXIMATE. THEREFORE, PRIOR TO THE COMMENCEMENT OF SITE ACTIVITIES, THE CONTRACTOR SHALL VERIFY THE LOCATION OF ALL EXISTING UTILITIES OR STRUCTURES IN THE AREAS OF WORK (CALL BEFORE YOU DIG: NJ 1 CALL – 1–800–272–1000). IF UTILITIES ARE TO REMAIN IN PLACE, PROVIDE ADEQUATE MEANS OF PROTECTION. THE CONTRACTOR SHALL CONFIRM THAT ANY ABANDONED UTILITY LOCATED WITHIN THE LIMIT OF WORK HAS BEEN ABANDONED IN ACCORDANCE WITH THE REQUIREMENTS OF THE UTILITY OWNER AND THE CITY OF JERSEY CITY.

GN5. ALL SPECIFIED WORK SHALL BE IN ACCORDANCE WITH ALL FEDERAL, STATE AND LOCAL REGULATIONS AND ORDINANCES.

GN6. BITUMINOUS PAVEMENT, CURBS, UTILITIES, FENCING AND ALL OTHER ASPECTS OF OFF–SITE FEATURES SHALL BE RESTORED UPON COMPLETION OF THE WORK UNLESS OTHERWISE INDICATED. ON–SITE DISTURBED AREAS SHALL BE FINISHED WITH TOPSOIL AND SEEDED, FINISHED WITH A GRAVEL SURFACE, OR PAVED AS INDICATED. IF SITE REDEVELOPMENT ACTIVITIES ARE SCHEDULED FOR STARTUP WITHIN 30 DAYS OF COMPLETION OF REMEDIAL CONSTRUCTION, ON–SITE AREAS (OUTSIDE NJDOT R.O.W.) INDICATED TO BE PAVED MAY BE FINISHED WITH GRAVEL.

GN7. A DECONTAMINATION PAD SHALL BE PLACED ADJACENT TO THE CURRENT WORK AREA. AS THE AREA OF EXCAVATION CHANGES THE PAD SHALL BE RELOCATED AS REQUIRED.

GN8. CONSTRUCTION WATER MANAGEMENT AND DEWATERING WILL BE REQUIRED DURING REMEDIAL CONSTRUCTION ACTIVITIES. GROUNDWATER DEPTH VARIES FROM APPROXIMATELY 4 FEET TO 7 FEET BELOW GROUND SURFACE. SOIL EXCAVATION WILL BE CONDUCTED TO A MAXIMUM APPROXIMATELY 18 FEET BELOW GROUND SURFACE IN CHROMIUM EXCAVATION AREAS. EXCAVATION AREAS ARE TO BE DEWATERED PRIOR TO EXCAVATION. SURFACE WATER AND GROUNDWATER THAT POTENTIALLY CONTACTS CONTAMINATED MATERIALS AND/OR IS REMOVED FROM AN EXCAVATION BY SUMPS OR DEWATERING WILL BE PROCESSED AT A CONSTRUCTION WATER TREATMENT SYSTEM AND DISCHARGED TO THE JCMUA SEWER SYSTEM. TREATMENT AND DISCHARGE OF DEWATERING WATER WILL BE PERFORMED IN ACCORDANCE WITH THE REQUIREMENTS OF JCMUA, AND THE APPLICABLE TWA AND PVSC PERMITS AND APPROVALS TO BE SECURED BY HONEYWELL. CONTRACTOR TO PROVIDE ALL LAB TESTING.

GN9. THE DEWATERING DISCHARGE FROM SA–6 SOUTH WILL BE ROUTED TO THE CONSTRUCTION WATER TREATMENT SYSTEM LOCATED ON SA–6 NORTH.

GN10. SEQUENCING OF SITE PREPARATION, PAVEMENT REMOVAL, DEMOLITION ACTIVITIES, SET UP OF SCALES, MATERIALS STORAGE, ON–SITE TRAFFIC PLANNING/ROUTING, ESTABLISHMENT OF WORKER PARKING AREAS, OFFICE OR STORAGE TRAILERS, PERIMETER FENCING, DECONTAMINATION PADS, AND ANY OTHER NON–GROUND INTRUSIVE ACTIVITIES SHALL BE COORDINATED WITH THE SEQUENCE OF CONSTRUCTION.

GN11. DELINEATION OF EXCAVATION LIMITS AND DEPTHS ARE BASED ON THE LIMITS OF CHROMIUM IMPACT ESTABLISHED DURING THE SOIL SAMPLING AND TESTING PROGRAMS CONDUCTED TO ESTABLISH PRE–EXCAVATION SOIL CHARACTERIZATION LEVELS. ONLY LIMITED VERIFICATION SAMPLING WILL BE REQUIRED. CONTRACTOR SHALL MAKE PROVISIONS FOR WORKING IN ALTERNATE REMEDIATION AREAS WHILE SAMPLE RESULTS ARE BEING PROCESSED. IMPACTED SOIL SHALL BE LOADED DIRECTLY INTO HAUL TRUCKS TO THE EXTENT PRACTICAL. SOIL SUITABLE FOR REUSE ON–SITE SHALL BE SEGREGATED FROM IMPACTED SOIL TO BE DISPOSED OFF–SITE. REFER TO THE SOIL MANAGEMENT PLAN FOR ADDITIONAL REQUIREMENTS.

GN12. DURING SHORING INSTALLATION AND SOIL EXCAVATION ACTIVITIES ADJACENT TO AND AT ELEVATIONS BELOW ACTIVE/OCCUPIED EXISTING UTILITIES OR STRUCTURES, THE UTILITIES OR STRUCTURES SHALL BE MONITORED FOR SIGNS OF SOIL DISPLACEMENT OR MOVEMENT THAT WOULD INDICATE LOSS OF SOIL SUPPORT OR SETTLEMENT.

GN13. CONTRACTOR WILL BE REQUIRED TO MAINTAIN THE INTEGRITY OF BUILDINGS, EXISTING BULKHEAD, UTILITIES AND OTHER SITE FEATURES AND REPAIR ANY DAMAGE AT NO ADDITIONAL COST TO HONEYWELL.

GN14. DURING EXCAVATION ACTIVITIES, PROTECT THE EXPOSED SOIL FROM EXCESS DRYING (KEEP MOIST BUT NOT WET). ALSO PROTECT CUT SLOPES FROM EROSION DUE TO PRECIPITATION OR STORM RUNOFF AND DETERIORATION DUE TO CONSTRUCTION ACTIVITIES (FOOT OR EQUIPMENT TRAFFIC). USE OF A TACKAFIER OR TEMPORARY STABILIZATION FABRIC IS PERMITTED.

GN15. HONEYWELL WILL CONTRACT THE SOIL TRANSPORTATION AND DISPOSAL DIRECTLY WITH THE DISPOSAL FACILITY. THE CONTRACTOR WILL ASSIST IN THE PREPARATION OF DISPOSAL DOCUMENTATION (I.E. MANIFESTS, CHARACTERIZATION) REQUIRED BY THE DISPOSAL FACILITY.

GN16. THE HEPSCD AND JCMUA RESPECTIVELY WILL BE NOTIFIED 72 HOURS PRIOR TO THE START OF WORK AND/OR RESTART OF SEWER CONSTRUCTION.

GN17. ELEVATIONS ARE BASED ON NGVD 1929 DATUM. COORDINATES ARE IN THE NEW JERSEY STATE PLANE COORDINATE SYSTEM, NAD 1983.

GN18. EXISTING CONDITIONS SHOWN ON THESE PLANS ARE BASED ON THE UTILITY AND TOPOGRAPHIC SURVEY OF STUDY AREA 6 SOUTH FOR LOTS 9H, 9L, 10E, 10H, 11H, 11Y, 12A, 17, 18, 19, AND 20 IN BLOCK 1290.1 SITUATED IN HUDSON COUNTY, NEW JERSEY PREPARED BY MASER CONSULTING P.A. ON DECEMBER 17, 2010 UNDER THE DIRECT SUPERVISION GLEN J. LLOYD, P.L.S. LICENSE NO. GS037598.

GN19. FLOOD HAZARD AREA (EL 10.2 NGVD) SHOWN ON THESE PLANS IS BASED ON STATE OF NEW JERSEY DEPARTMENT OF ENVIRONMENTAL PROTECTION – DIVISION OF WATER RESOURCES TITLED DELINEATION OF FLOODWAY AND FLOOD HAZARD AREA FLOOD PROFILES – PASSAIC RIVER STA 410+00 TO 920+00.

GN20. WORK WITHIN THE N.J.D.O.T. R.O.W. WILL REQUIRE CO–ORDINATION WITH AND MAY REQUIRE SUBCONTRACTING WITH N.J.D.O.T. FOR TRAFFIC CONTROL AND OTHER SERVICES. THE COST OF ALL SUCH SERVICES WILL BE BORNE BY THE CONTRACTOR. WORK WITHIN 3 FEET OF THE 24 INCH GAS LINE WILL REQUIRE PSE&G OVERSIGHT.

GN21. CHROMIUM IMPACTED SOIL THAT ALSO CONTAIN NON–CHROMIUM COC'S THAT DO NOT MEET THE NJDEP'S DEFINITION OF HISTORIC FILL AS IDENTIFIED ON DRAWING C–104, WILL BE DISPOSED OFF SITE. SOILS THAT CONTAIN CONCENTRATIONS BELOW 20 MG/KG FOR HEXAVALENT CHROMIUM AND CONTAIN NON–CHROMIUM COC'S THAT MEET THE NJDEP'S DEFINITION OF HISTORIC FILL, WILL BE EXCAVATED, STAGED AND MANAGED SEPARATELY FROM CHROMIUM–IMPACTED SOILS. AS IDENTIFIED IN THE SMP, STOCKPILES OF SUCH HISTORIC FILL SOILS WILL BE TESTED TO CONFIRM THAT THE HEXAVALENT CHROMIUM CONCENTRATIONS ARE BELOW 20 MG/KG. IF SUCH SOILS ARE CONFIRMED TO BE BELOW 20 MG/KG FOR HEXAVALENT CHROMIUM, THIS SOIL MAY BE USED AS TEMPORARY SURCHARGE IN THE CAP AREAS, BACKFILL FOR EXCAVATIONS, OR TO RAISE THE GRADES FOR THE REDEVELOPMENT PROJECT OUTSIDE OF THE CAP AREA.

GN22. ACCESS RAMP TO THE GWTP WILL BE COMPLETED PRIOR TO THE IMPLEMENTATION OF THE CHROMIUM REMEDY.

GN23. GROUNDWATER TREATMENT PLANT AND ASSOCIATED UTILITIES, TRUCK CONTAINMENT PAD, AND THE GRAVEL BYPASS WILL BE COMPLETED EARLY IN THE IMPLEMENTATION OF THE CHROMIUM REMEDY.

STRUCTURAL STEEL

SS1. STEEL FILLER PLATES AND WEDGE PAIRS SHALL BE INSTALLED TO PROVIDE FULL BEARING BETWEEN SHEET PILES AND WALES.

SS2. SHOP AND FIELD WELDING PROCEDURES, ELECTRODE CLASSIFICATION, AND PREHEAT TEMPERATURE SHALL CONFORM TO AWS D1.1. WELDERS SHALL BE CERTIFIED IN ACCORDANCE WITH AWS D1.1 CRITERIA.

SS3. WHERE EXCAVATIONS ARE TO BE CONDUCTED ADJACENT TO THE HYDRAULIC BARRIER OR TEMPORARY EXCAVATION SUPPORT IS TO BE INSTALLED, THAT SHEETING OR SUPPORT SYSTEM WILL EXTEND A MINIMUM OF 1 FT ABOVE THE SURROUNDING GRADE UNTIL SUCH TIME AS THE EXCAVATION IS COMPLETED, AT WHICH TIME THE BARRIER WALL MAY BE TRIMMED TO THE GEOMEMBRANE SUBGRADE ELEVATION AND TEMPORARY SUPPORT MAY BE REMOVED. AT NO TIME DURING EXCAVATION WILL THE TOP OF THE BARRIER WALL OR TEMPORARY SUPPORT BE LESS THAN ELEVATION 10.7 OR LESS THAN THE ELEVATION OF THE GEOMEMBRANE LINER (WHICHEVER IS THE GREATER)

HYDRAULIC BARRIER TECHNICAL REQUIREMENTS

HB1. PERMANENT SHEET PILE SHALL BE ORDERED IN LENGTHS CONSISTENT WITH THAT REQUIRED TO MEET THE MINIMUM TOE AND TOP ELEVATIONS. FIELD SPLICING OF SHEETS WILL NOT BE PERMITTED. SHEETS WILL BE DRIVEN TO THE TOP DESIGN ELEVATION TO MINIMIZE THE NEED TO CUT SHEETS. SHEETS MAY BE DRIVEN DEEPER THAN THE "MINIMUM" DESIGN TOE TO MEET THE TOP ELEVATION REQUIREMENT. REFER TO DRAWINGS S–201 THRU S–203 FOR TOP OF SHEET ELEVATIONS.

HB2. HANDLE SHEET PILES IN A MANNER WHICH PREVENTS DAMAGE TO THE SHEET PILE AND EPOXY COATING. ANY DAMAGE TO THE SHEET OR EPOXY COATING WILL BE REPAIRED MEETING THE REQUIREMENTS NOTED IN HB11 BELOW. USE LIFTING HOLES AND STANDARD SAFETY LIFTING DEVICES OR PROVIDE SECONDARY SUPPORT DURING LIFTING.

HB3. SUPPORT SHEETS ON BLOCKS SPACED NOT MORE THAN 10 FT APART, AND NOT MORE THAN 2 FT FROM THE ENDS. SUPPORTS BETWEEN SHEETS, AND BETWEEN SHEET LIFTS, SHALL BE IN A VERTICAL PLANE.

HB4. IF SPUDDING IS REQUIRED DISCONTINUE SPUDDING MORE THAN 5 FT ABOVE THE MINIMUM TIP ELEVATIONS.

HB5. REMOVE AND REPLACE STEEL SHEET PILES FOUND TO BE OUT OF INTERLOCK, OUT OF TOLERANCE, DAMAGED, OR OTHERWISE DEFICIENT.

HB6. STAGE PILE DRIVING AND STEP SHEET PILE TIPS AS NECESSARY TO PREVENT PILE DISPLACEMENT FROM PLUMB.

HB7. SHEET PILES MAY BE WELDED TO ADJACENT SHEETS IF OTHER MEANS TO CONTROL SETTLEMENT DURING DRIVING IS PROVIDED. HOWEVER ANY WELDED AREAS WILL REQUIRE REPAIR CONSISTENT WITH THE REQUIREMENTS OF HB11 BELOW.

HB8. SHEETS WILL BE PITCHED AND DRIVEN IN A MANNER TO AVOID DAMAGE TO THE EPOXY COATING WHILE MAINTAINING THE SHEET PILE IN THE CORRECT PLAN LOCATION AND VERTICALITY. THE CONTRACTOR WILL UTILIZE MEANS AND METHODS TO PREVENT SHEETS FROM WARPING OR WRACKING.

HB9. PROVIDE CONTINUOUS INSPECTION OF SHEET PILE DRIVING. INSPECT LOCATION AND VERTICALITY WHEN SETTING SHEETS, AND WHEN SHEETS ARE DRIVEN HALF DEPTH.

HB10. MAINTAIN PILE DRIVING INSPECTION RECORD FOR EACH PAIR DRIVEN. INDICATE PILE HAMMER, RATE OF OPERATION, ENERGY, USE OF DRIVE HELMET AND CAP, ETC. PROVIDE A UNIQUE NUMBER FOR EACH PAIR, AND INDICATE LOCATION ON ALIGNMENT. DOCUMENT INSTALLATION DATE, SET TIME, DRIVE DURATION, AND TIME DRIVE COMPLETED, INITIAL PILE LENGTH, RE–HEADING OR CUTTING LENGTH(S), AND ANY ADDITIONAL INFORMATION REQUIRED FOR RECORD DRAWINGS. RECORD UNUSUAL CONDITIONS OR PROBLEM OBSERVED DURING DRIVING.

HB11. COAL TAR EPOXY COATING REQUIREMENTS:

a. COAT STEEL SHEET PILES, CONNECTOR PILES AND FABRICATED CONNECTOR PILES WITH TWO COATS, 8 MILS DRY FILM THICKNESS (DFT) EACH, COAL TAR EPOXY. COAL TAR EPOXY COATING SHALL BE APPLIED FROM THE FINAL TOP OF SHEET (WHEN TRIMMED FOR LINER INSTALLATION) TO THE BOTTOM OF THE SHEET OR A MAXIMUM OF 5 FEET BELOW THE INTERPRETED TOP OF STRATUM D ON BOTH THE OUTBOARD AND INBOARD FACES OF THE SHEETPILES.

b. COAL TAR EPOXY COATING SHALL BE "BITUMASTIC NO. 300–M" A MANUFACTURED BY CARBOLINE OR APPROVED EQUAL.

c. ALL SURFACES TO BE COATED SHALL BE SAND–BLASTED IN PREPARATION FOR APPLICATION OF THE COATING. SAND–BLASTING SHALL BE TO NEAR WHITE METAL, AT LEAST EQUIVALENT TO A COMMERCIAL BLAST AS DEFINED BY SSPC–SP–10. ALL SURFACES TO BE COATED MUST BE COMPLETELY DRY, FREE OF MOISTURE, SOIL, DUST AND GRIT AT THE TIME THE COATING IS APPLIED.

d. APPLICATION OF THE COATINGS AND CURING REQUIREMENTS SHALL BE IN CONFORMANCE WITH THE MANUFACTURER'S REQUIREMENTS.

e. WHERE WELDING, FASTENINGS, CUTTING OR OTHER WORK ARE TO BE ACCOMPLISHED AFTER INSTALLATION OF PILES, FIELD APPLIED PROTECTIVE COATS SHALL BE COMPLETED.

f. THE CONTRACTOR SHALL APPOINT AND PAY FOR AN INDEPENDENT INSPECTION AND TESTING AGENCY, APPROVED BY THE ENGINEER, TO INSPECT AND CERTIFY THE COATING PROCEDURE DURING EACH OF THE FOLLOWING CERTIFICATIONS:

i) CERTIFY THAT THE STEEL HAS BEEN PREPARED FOR COATING IN ACCORDANCE WITH THE COATING MANUFACTURER'S RECOMMENDATIONS AND ADDITIONAL REQUIREMENTS NOTED HEREIN.

i) CERTIFY THE THICKNESS OF THE TWO EPOXY COATS AND THAT EACH COAT IS APPLIED IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS AND TO THE DRY FILM THICKNESS SPECIFIED.

iii) THE OWNER SHALL RESERVE THE RIGHT TO CONDUCT INDEPENDENT QUALITY ASSURANCE INSPECTIONS. REJECTED SHEETS WILL BE REPAIRED OR REPLACED ON NO ADDITIONAL COST TO THE OWNER.

HB12. SEALANT SHALL BE GUN GRADE SWELL SEAL WA HYDROPHILIC POLYURETHANE WATER STOP, MANUFACTURED BY DENEEF CONSTRUCTION CHEMICALS OF HOUSTON, TX. OR APPROVED EQUAL. REFER TO SPECIFICATIONS 01010 SECTION 5 SUBSECTION 5.

HB13. INSTALLATION OF SWELL SEAL SHALL BE PERFORMED IN ACCORDANCE WITH SPECIFICATION 02180 "SPECIAL INSTRUCTIONS" SECTION 3.03.

HB14. SHEET PILE WILL BE PROVIDED IN PREWELDED, PRECOATED PAIRS.

HB15. TEMPORARY SHEET PILE FOR EXCAVATIONS WILL BE LEFT A MINIMUM OF 1 FOOT ABOVE EXISTING GRADE OR 6–INCHES ABOVE 100 YEAR FLOOD ELEVATION WHICHEVER IS HIGHER.

HB16. AFTER CUTTING SHEETPILE TO FINAL ELEVATION, AS PART OF CAP CONSTRUCTION A SECTION OF GCL WILL BE PLACED BETWEEN THE TOP OF SHEETING AND THE CAP LINER IN AREAS BELOW THE SITE HISTORIC WATER SEE DRAWING C–301 DETAIL G FOR ADDITIONAL INFORMATION.

HB17. THE HYDRAULIC BARRIER WILL EXHIBIT FLOW PROPERTIES EQUAL OR BETTER THAN THAN A ONE FOOT WIDE BARRIER WITH A HYDRAULIC CONDUCTIVITY OF 1X10–6 CM/SEC.

HB18. FOR SHEET SEALING AND GROUTING BEFORE AND AFTER DRIVING, SEE SHEET C–515 DETAIL BF.

HB19. THE AREA INDICATED ON SHEETS S–201 TO S–203 FROM STATION 0+00 TO STATION 17+80 18+50 WILL BE SEALED WITH A CEMENT BENTONITE GROUT IN LIEU OF HYDRAULIC SEALANT. THIS PORTION OF THE WALL WILL BE FABRICATED WITH A 2 ½" X 3/8" ANGLE AND ½" HDPE GROUT PIPE FROM THE TOP OF THE INTERLOCK TO THE DEPTH OF STRATUM D SOILS. SEE DRAWING S–203 DETAIL BF AND SPECIFICATION SECTION 02180 FOR ADDITIONAL INFORMATION.

HB20. IN LOCATIONS WHERE CPT OR BORING ENCOUNTER REFUSAL AT DEPTHS OF <10 FEET TEST PITS OR PRE–TRENCHING WILL BE CONDUCTED TO VERIFY THAT POTENTIAL OBSTRUCTIONS HAVE BEEN REMOVED PRIOR TO DRIVING SHEETS.

HB21 PSE&G IS EVALUATING POLE RELOCATION AND RE–ROUTING OF ELECTRICAL SERVICE TEMPORARILY TO THE EAST SIDE OF ROUTE 440 TO FACILITATE HYDRAULIC BARRIER INSTALLATION. PSE&G PLANNING MAY ALSO BE IMPACTED BY THE ROUTE 440 WIDENING. IF CHANGES CANNOT BE IMPLEMENTED IT MAY BE NECESSARY TO INSTALL THE WALL INBOARD OF EXISTING LOCATIONS TO COMPLY WITH OSHA OVERHEAD CLEARANCE REQUIREMENTS AND DEFER REMEDIATION OF THE REMAINING STRIP.

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 004 Minor (a)<br>Effective Date: 8/14/13 |
| Project Location: SA6-SOUTH | Associated RFI: |
| Title: Hydraulic Barrier Straightening SA6 South | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

Description of Change/Modification:

The hydraulic barrier alignment for SA-6 South between Station 21+00 and 22+00 is to be straightened to eliminate an offset in the wall that was an artifact of historic property lines that are no longer applicable. Corners, and the Stationing from 21+00 on is to be adjusted to account for the elimination of the 3-ft offset in the wall.

# FINAL DCB 005 – ANALYTICAL TESTING OF BACKFILL

Honeywell RES

Honeywell.com

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 005 Minor(a)<br>Effective Date: 9/24/13 |
| Project Location: SA-6 NORTH SA6-SOUTH | Associated RFI: |
| Title: Analytical Testing Frequency for Imported Borrow Materials | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

Description of Change/Modification:

The testing frequency for analytic parameters for imported borrow materials is to be modified to 1 test/ 5,000 CY of borrow material anticipated to be needed.

| | |
|---|---|
| Reason for Change/Modification:<br>☐ Unforeseen or Differing Site Conditions<br>☐ Design Revision<br>☑ Owner/Client Request<br>☐ Other (describe) | Explanation or Reason: Honeywell directed modification.<br>Attachments: ☐ Yes ☑ No<br>Cost Implication: ☑ Yes ☐ No<br>>$50k ☐ Yes ☑ No<br>Schedule Implication ☐ Yes ☑ No |
| Additional Comments:<br>The original specified minimum frequency was 1 sample per source. The frequency was increased to 1 sample per 5000 CY at the request of Honeywell, consistent with frequencies tested on imported virgin source materials on SA7. | Design Documents Affected:<br>Technical Specifications<br>Section 02315-10 2.13 Borrow Source Testing A. 1,2,3 Frequency |

Honeywell (AP) Review:

| Individual | Discipline | Initial | Date |
|---|---|---|---|
| | | | |

| | |
|---|---|
| (Name / Signature): Samuel G. Ethridge | Does DCB Result in CCO? ☐ Yes(b) ☑ No<br>Date: 5/2/14 |

Distribution:

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval
(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

placed. Horizon B soils will be a uniform sandy loam having the following properties:

Sandy loam classification having 80% sand, ≤ 10% silt, 10% clay.
Ph range 5.5 – 7.0.
Organic Matter (by weight) 1.5-3.5%.

C. Soil Horizon C – During Interim Grading Horizon C Soil will be placed between the root barrier and the Horizon A soil. The first 6 inches of Horizon C soils to be placed directly above the root barrier will be compacted to a minimum 90% of Standard Proctor. To meet Final Grading and planting requirements Horizon A soils will be stripped as necessary and Horizon C soils shall be re-graded to provide an appropriate depth of 18 inches. Horizon C soil shall consist of uniform sandy loam having the following properties:

1. Sandy loam classification with 70-80% sand, ≤ 10% silt, 15-20% clay.
2. pH range 5.0 – 7.5.
3. Organic Matter (by weight) 1 % max.

## 2.13 BORROW SOURCE TESTING

A. Borrow source testing, including geotechnical characterization requirements, shall be conducted on all soil materials proposed for construction. Minimum third-party geotechnical laboratory testing requirements and frequency for materials are listed as follows:

1. Common Borrow, Geocomposite Drainage Layer Cover Soil, Cushion Fill, Dense Graded Aggregate, Planting Soils (Horizons B and C):

| Test | Methodology[1] | Frequency[2] |
|---|---|---|
| Particle-Size Analysis | ASTM D 422 | 1 test/5000 cy/material (to #200 Sieve) |
| Standard Proctor | ASTM D 698 | Min. 3 test/source/material 1 test/5000 cy |

2. Topsoil (Horizon A):
   Refer to Section 02900, "Topsoil and Seeding".
3. Crushed Stone:

| Test | Methodology[1] | Frequency[2] |
|---|---|---|
| Particle-Size Analysis | ASTM D 422 | 1 test/5000 cy/material (to #200 Sieve) |

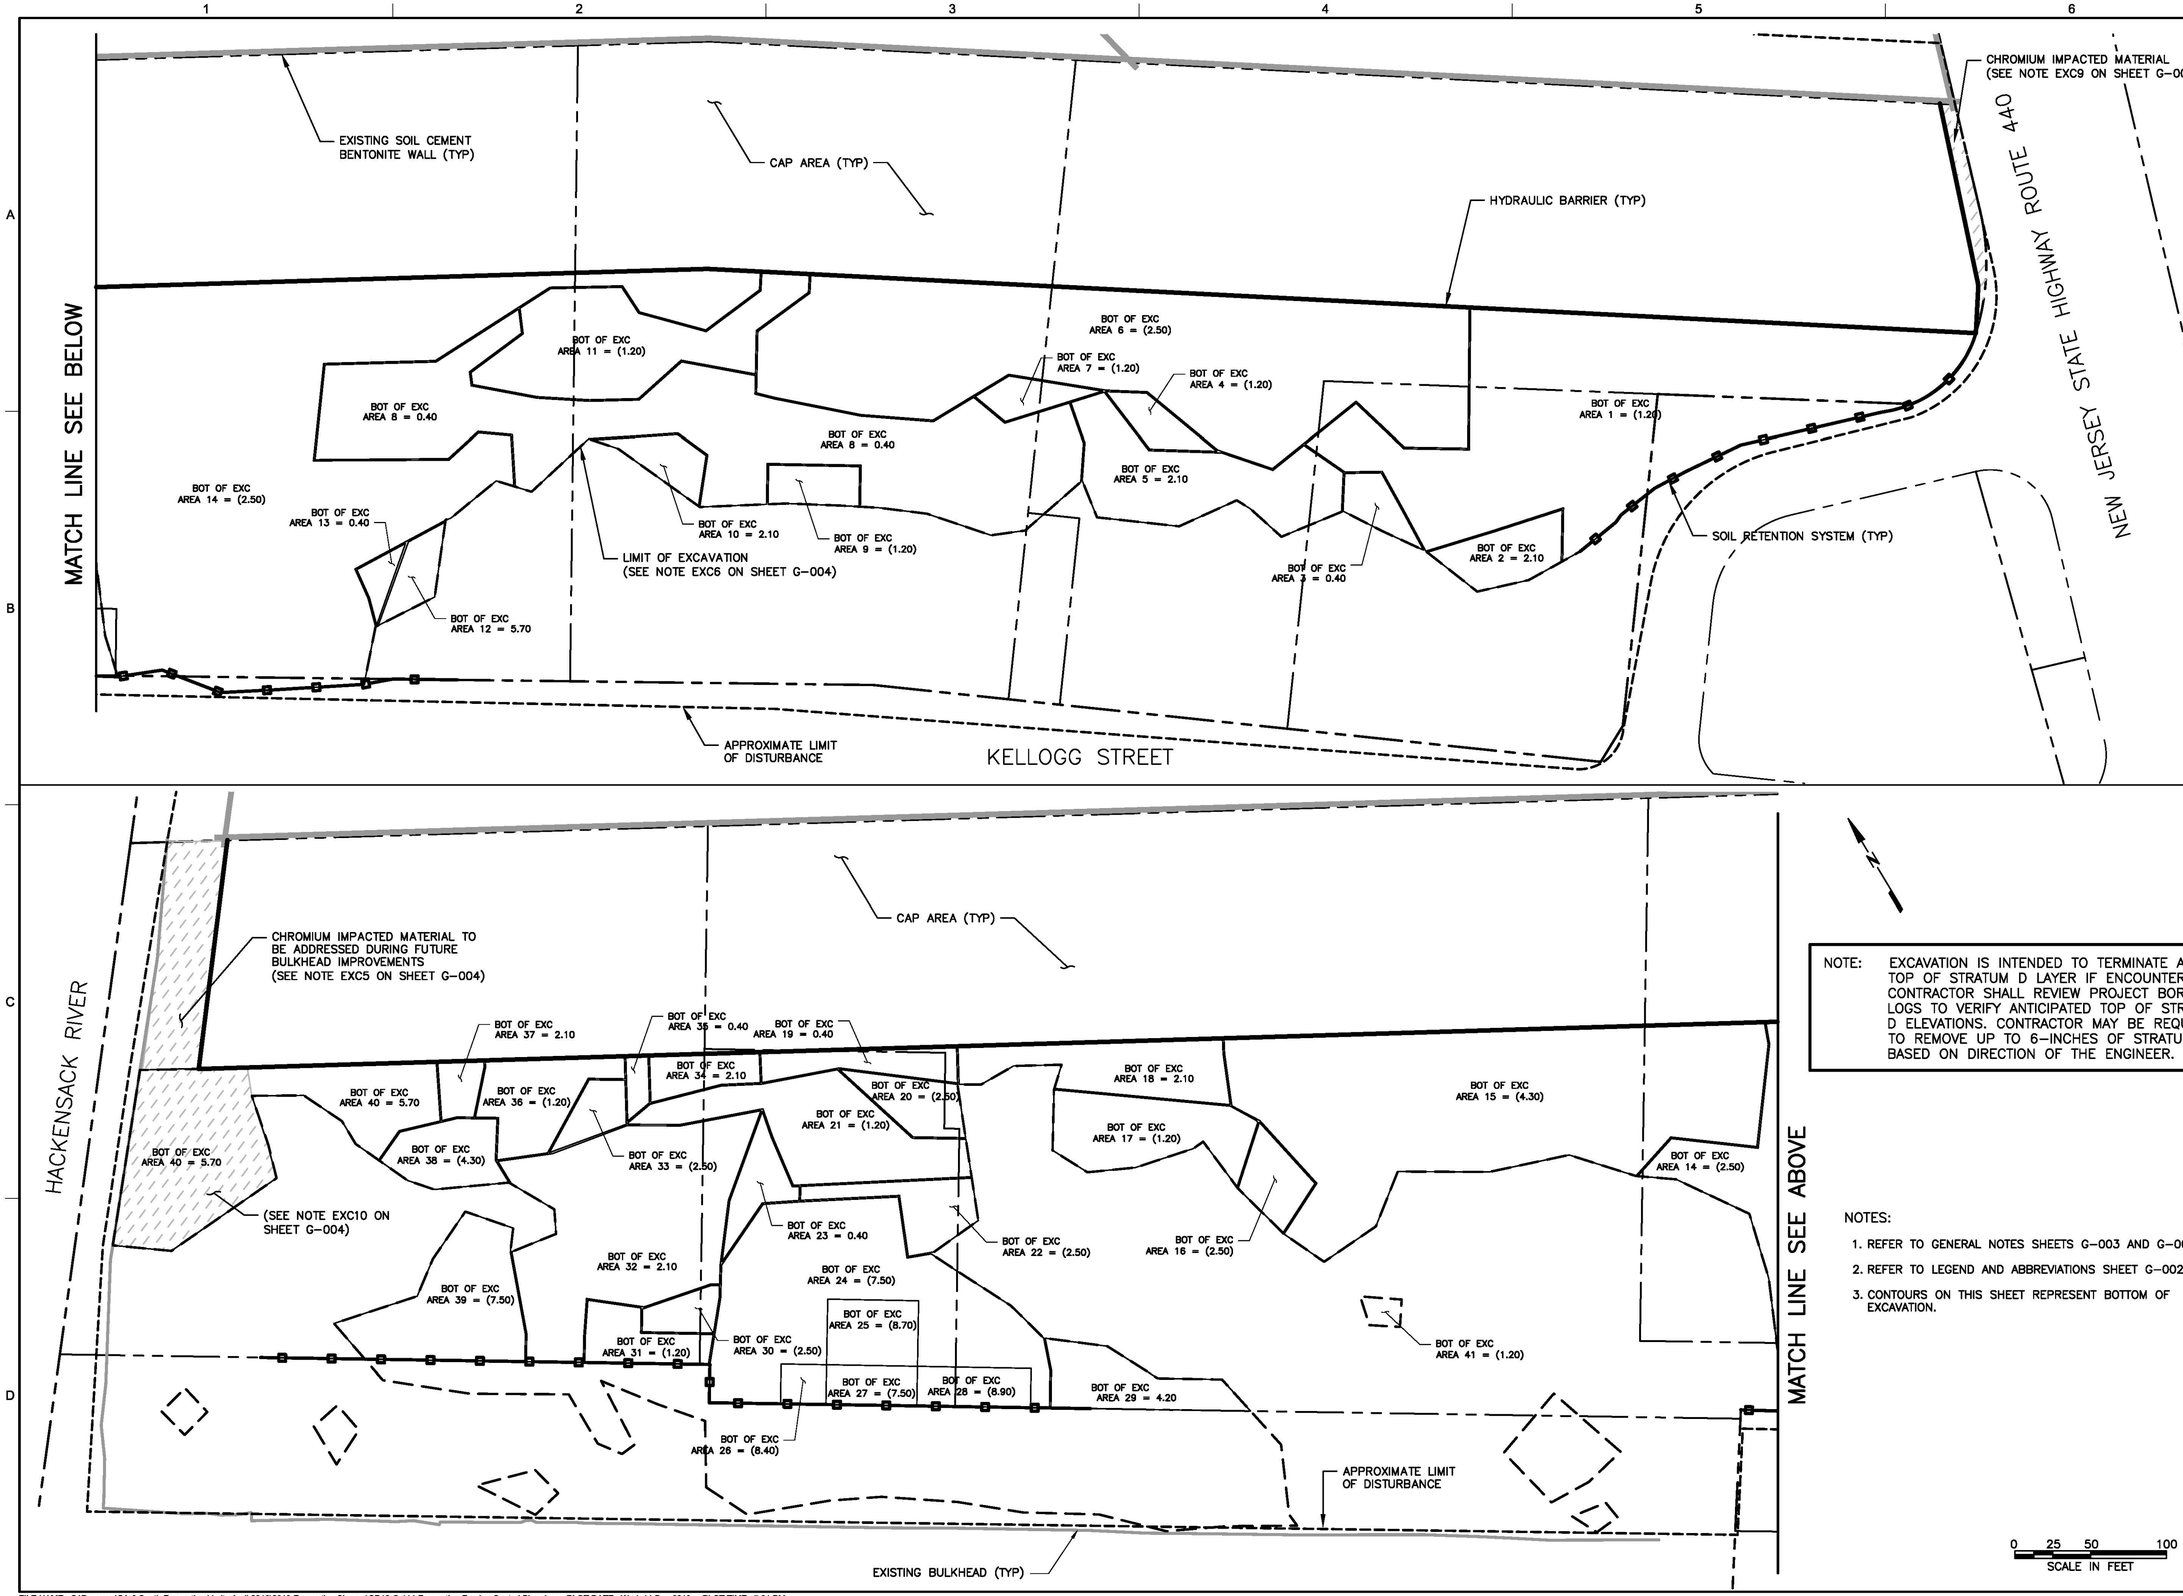
B. Borrow Source Testing Notes:

1. Other testing methods may be considered acceptable, based on prior approval of the Engineer.
2. Testing frequency shall be as listed, at any change in borrow source, or at any discernable change in material delivered to the site (as determined by the Engineer).
   a. Common Borrow shall be certified clean from the borrow source or origin, based on analytical testing data, as approved by the Engineer.
      1. Soils shall be tested and certified "clean" relative to the NJDEP Technical Requirements pursuant to 7:26E 5.2(d) 2.

**FINAL DCB 006 – EXCAVATION SHAPES**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 006 Major (a)(b)<br>Effective Date: 12/12/13 |
| Project Location: SA6-SOUTH | Associated RFI: |
| Title: Revised Excavation Shapes, Bottom of Excavation Elevations, and Post-Excavation Samples | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |



Description of Change/Modification:

The proposed bottom of excavation elevations have been modified in limited areas to expose Post-Excavation Samples as reported on the revised PDI summary tables which are attached to this DCB. Excavation Interval shapes have been revised to coincide with the revised bottom of excavation elevations and limits. This DCB also includes a color coded excavation bottom map to assist with interpreting the bottom of excavation elevations as depicted on the revised design drawings. In addition this DCB includes a table summarizing- Post-Excavation Reference (R) Samples for each area. These (R) samples are to be referenced in the weekly reports when a base PDI sample is not present in a specific 15 ft wide cells being used by Entact for construction control. This DCB includes the following documents:

- Design Drawings 16-25
- PDI Tables 1, 2, 3B, and 3C
- Figure 2 SA-6 South Color Coded Excavation Bottom
- Table 1 SA-6 South Reference Confirmation Samples

| | |
|---|---|
| Reason for Change/Modification:<br>☐ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | Explanation or Reason: Expose Confirmation Samples as Indentified in Revised PDI Tables<br>Attachments: ☑ Yes ☐ No<br>Cost Implication: ☑ Yes ☐ No<br>>$50k ☑ Yes ☐ No<br>Schedule Implication ☑ Yes ☐ No |
| Additional Comments: Major DCB anticipated to require review and approval by third parties. The changes result in an increase to the excavation quantity. | Design Documents Affected:<br>Drawings 16-25<br>PDI Tables 1, 2, 3B, and 3C |
| Honeywell (AP) Review:<br>Individual Discipline | Initial [signature] Date 12/20/16 |
| (Name / Signature): | Does DCB Result in CCO? ☑ Yes(b) ☐ No<br>Date: |
| Distribution: | |

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval
(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

NOTE: EXCAVATION IS INTENDED TO TERMINATE AT TOP OF STRATUM D LAYER IF ENCOUNTERED. CONTRACTOR SHALL REVIEW PROJECT BORING LOGS TO VERIFY ANTICIPATED TOP OF STRATUM D ELEVATIONS. CONTRACTOR MAY BE REQUIRED TO REMOVE UP TO 6–INCHES OF STRATUM D BASED ON DIRECTION OF THE ENGINEER.

NOTES:

1. REFER TO GENERAL NOTES SHEETS G–003 AND G–004
2. REFER TO LEGEND AND ABBREVIATIONS SHEET G–002
3. CONTOURS ON THIS SHEET REPRESENT BOTTOM OF EXCAVATION.

LEGEND

- HEXAVALENT CHROMIUM SOIL CONTAMINATION UNDER 20 PPM
- HEXAVALENT CHROMIUM SOIL CONTAMINATION BETWEEN 20-240 PPM
- HEXAVALENT CHROMIUM SOIL CONTAMINATION OVER 240 PPM
- HEXAVALENT CHROMIUM SOIL CONTAMINATION OVER 1000 PPM
- AREAS OF IN-SITU TREATMENT BELOW 3 FEET
- NO EXCAVATION REQUIRED

NOTES:

1. REFER TO GENERAL NOTES SHEET G-003 AND G-004.
2. REFER TO LEGEND AND ABBREVIATIONS SHEET G-002.

NOTE: EXCAVATION IS INTENDED TO TERMINATE AT TOP OF STRATUM D LAYER IF ENCOUNTERED. CONTRACTOR SHALL REVIEW PROJECT BORING LOGS TO VERIFY ANTICIPATED TOP OF STRATUM D ELEVATIONS. CONTRACTOR MAY BE REQUIRED TO REMOVE UP TO 6-INCHES OF STRATUM D BASED ON DIRECTION OF THE ENGINEER.

NOTES:
mg/kg = milligrams per kilogram
SW = post-excavation sidewall sample
SW* = sample defines horizontal limit of hexavalent chromium impacts, but is below the target bottom of excavation elevation. These samples are not counted in Table 1.
SW** = 134-SB-146 delineates an area in the northern portion of Site 163, so it is not counted in the tally for Site 134.
HD = soil sample defines horizontal limit of hexavalent chromium impacts
D = duplicate sample
U = detected below indicated value
J = Estimated Value

NOTES:
mg/kg = milligrams per kilogram
B = post-excavation base sample
B* = post-excavation base sample that may be excavated due to multi-depth excavation extensions.
B** = post-excavation base sample not counted in Table 2 due to the proximity of a shallower post-excavation base sample that is counted in Table 2.
B*** = new bottom samples added based upon excavation means and methods
VD = soil sample defines vertical limit of hexavalent chromium impacts
VD* = vertical delineation sample that may be excavated due to multi-depth excavation extensions.
D = duplicate sample
U = detected below indicated value
J = Estimated Value

**FINAL DCB 007 –SA-6 DCB FRENCH DRAIN**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB Type: Major (a)<br>Effective Date: 3/25/14 |
| Project Location: SA-6 NORTH, SA6-SOUTH | Associated RFI: |
| Title: CONTINGENT GW EXTRACTION SYSTEM | ☐ Yes, RFI No. ___ ☑ None |
| REPLACE WELLS WITH TRENCHES | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

The 100% Design included a Conceptual Design for the Groundwater Extraction system that was based on use of 9 extraction wells in each open space area and common header system. This Bulletin describes a major change to that extraction system and explains the basis for that change.

Section 10.2 of the Design Report stated "Honeywell reserves the right to propose alternative groundwater extraction designs capable of meeting the criteria stated in Article III.A (58) of the Consent Decree. Additionally, Note 3 on the Contingent GW Extraction System Drawings SA-6 South C-201,202 and 203 and SA-6 North CN-201, 202 and 203 further elaborated that "Honeywell will continue to evaluate pertinent information gathered through dewatering and other construction operations. This information will be used to calibrate the groundwater capture model. Subject to the results of that model calibration and evaluation of the system design Honeywell may propose alternative groundwater extraction designs".

The SA-6 South Groundwater Modeling Report Appendix B Section 5 indicates that Honeywell evaluated various pumping scenarios including the option of French Drains/Central drain. The results of the central/French drain scenario were shown in Figure 5-3. From a modeling perspective it was concluded that the drain provided equivalent performance to the 9 wells.

Consistent with the approach indicated in the Design report, Honeywell has continued to evaluate data collected during the construction dewatering and excavation. Observations of the well point dewatering system have indicated a great deal of variability in hydraulic properties from point to point. Observation of the excavation has also shown significant variability in soil types and permeabilities.

Based on an evaluation of this variability and in consideration of the reduced maintenance advantages associated with the French drain system, Honeywell is proposing to modify the design to change the wells to a French Drain. This proposal is consistent with paragraph 58 of the First Amended Consent Decree on Remediation and Redevelopment of Study Area 6 North. This design change will impact drawings C-201, 202, 203 and CN-201,202,203. The use of trenches also

reduces the number of pumps, control panels, and cap penetrations. This will result in changes to the electrical drawings E-301, 302, 303 and EN-301-302 and 303.

| REPLACE WELLS WITH TRENCHES<br>Contractor (Subcontractor): Entact | Project No.: 3480130377 |

Description of Change/Modification:

DCB-007 has been issued to document changes to the Groundwater Removal System Design. This change includes changing from recovery wells to a "French drain" system. DCB 007 design will be issued is sections to allow for a "fast tracked" design and installation process.

Stage 1 (DCB-007.1) is limited to the French drain installation and the lower sections of the pump and access station manholes for SA-6 South. (see attached memo)

**The Drawings have certain design details clouded. These details have not been finalized and have not been issued for construction.**

**Subsequent stages of the design including the design for the SA-6N Groundwater Collection System will be issued under the DCB – 007 number. Examples DCB -007.2, DCB- 007.3.**

| Date: | **June 6, 2014** | cc: | **Joe Clifford, PE – Amec**<br>**Eric Christodoulatos - Amec** |
| From: | **Geoff Shallard, P.E.** | | |
| To: | **Stuart Bills - Amec** | | |
| Subject: | **DCB-007.1** | | |

DCB-007 has been issued to document changes to the Groundwater Removal System Design. This change includes changing from recovery wells to a "French drain" system

The new design will include installation of the following.

- a french drain including 8 inch HDPE perforated piping and 1 ½ inch crushed stone
- pump station manholes and associate frames and covers
- cleanout/access manholes and associated covers
- pumps and associated power and controls
- forcemain

Incidental to the basic design changes will include

- revisions to geomembrane liner grading
- revisions to final grades in the vicinity of pump stations

To facilitate progress the design details will be released in stages.

Stage 1 (DCB-007.1) is limited to the French drain installation and the lower sections of the pump and access station manholes for SA-6 South.

**The Drawings have certain design details clouded. These details have not been finalized and <u>have not been</u> issued for construction.**

**Subsequent stages of the design including the design for SA-6N will be issued under the DCB – 007 number. Examples DCB -007.2, DCB- 007.3.**

The pump station manhole should be constructed to the surcharge grade to allow for use of the system for groundwater control during surcharge and remedy construction prior to

capping. Manholes and the drain system will settle as the site consolidates. As a result flexibility needs to be retained to allow for setting access hatches to final grades. Temporary pumps will be used during the remedy.

**FINAL DCB 007.3 – SA-6 SOUTH CGWES**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 007.3 Major (a)<br>Effective Date: 02/12/15 |
| Project Location: SA-6 SOUTH | Associated RFI: |
| Title: GW EXTRACTION SYSTEM | o Yes, RFI No. NA_ None |
| REPLACE WELLS WITH TRENCHES | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

DCB-007.1 was issued for the trench detail portion of the modified groundwater system design. At the time of issue details for the SA-6N trench had not been finalized.
DCB-007.2 provided the details for the SA-6N groundwater collection trenches and associated electrical supply and groundwater discharge piping.
DCB-007.3 provides the details for the SA-6S groundwater collection trenches and associated electrical supply and groundwater discharge piping.

The 100% Design included a Conceptual Design for the Groundwater Extraction system that was based on use of 9 extraction wells in each open space area and common header system. The revised Design uses a trench design. Details related to the Administrative basis for the change are provided in DCB 007.1.

DCB 007.3 impacts the following drawings
The following Issued for Construction Drawings Extraction System that was based on 9 extraction wells are deleted

- C-201 Plan and Profile
- C-202 Plan and Profile
- C-203 Plan and Profile
- C-304 System Details

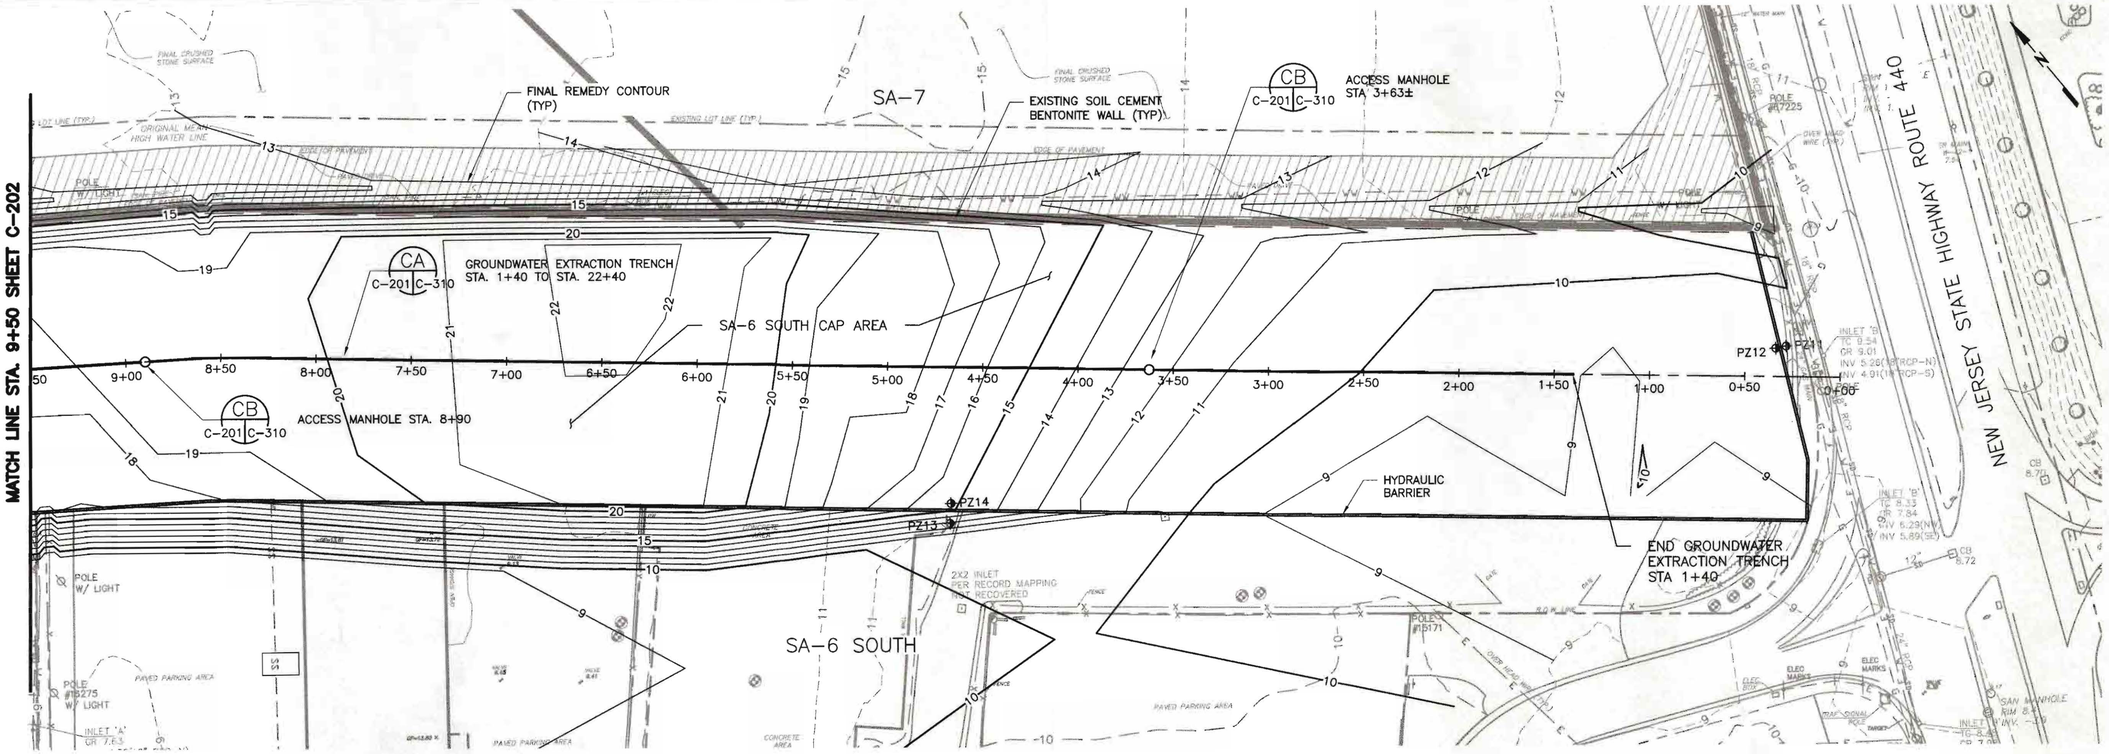
The following drawings for the Trench design were added.

- C-201 Trench Plan and Profile
- C-202 Trench Plan and Profile
- C-203 Trench Plan and Profile
- C-204 Discharge Force Main Plan and Profile)
- C-304 Details
- C-306 Details
- C-310 Details).

The changes from the well concept to the trench will also impact the Electrical Drawings. E-101, E-301, E-302 and E-303. The Electrical changes will be issued separately under DCB 007.4. It is noted that DCB 007.2 and DCB 007.3 does show the details for all pumps, motors and controls for the trench design.

The changes from the well concept to the trench will also impact the Geomembrane Liner Grading. The Geomembrane liner changes will be issued separately under DCB 007.5.

Note; piezometric pairs will be installed as shown on both SA-6N and SA-6S. The piezometers on north were previously shown as clouded/temporarily deferred.



| Reason for Change/Modification: | Explanation or Reason: Design changed based on information gathered during construction |

Distribution:

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval
(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

## NOTES:

1. REFER TO GENERAL NOTES SHEET G-003 AND G-004.
2. REFER TO LEGEND AND ABBREVIATIONS SHEET G-002
3. DEWATER AS NECESSARY TO PROVIDE SUITABLE CONDITIONS FOR PLACEMENT OF STONE AND HDPE PIPE.
4. USE SHEETING/SHORING TRENCH BOXES OR OTHER MEANS AS NECESSARY TO ALLOW FOR PLACEMENT OF FILTER STONE AND HDPE PIPE.
5. FINAL PLAN VIEW ALIGNMENT MAY BE ADJUSTED SUBJECT TO THE APPROVAL OF THE ENGINEER TO AVOID OBSTRUCTIONS SUCH AS EXISTING BUILDING FOUNDATIONS, ABANDONED UTILITIES AND PILES.
6. TRENCH INVERT HAS BEEN DESIGNED TO BE ABOVE STRATUM O AND STRATUM D. INVERTS MAY BE ADJUSTED DURING DESIGN DEVELOPMENT OR IN RESPONSE TO OBSERVED FIELD CONDITIONS SUBJECT TO THE APPROVAL OF THE ENGINEER AND GROUNDWATER MODELER.
7. PLACE STONE LOOSE IN GROUNDWATER COLLECTION TRENCH. RUN PLATE COMPACTOR OR EQUAL OVER TRENCH PRIOR TO INSTALLING GEOTEXTILE FABRIC.
8. BACKFILL ABOVE GEOTEXTILE FABRIC MAY BE COMPOSED OF EXCAVATED TRENCH SPOIL OR OTHER MATERIAL THAT CAN BE READILY COMPACTED. WET SOIL, OVERSIZED DEBRIS OR OTHER MATERIALS AS DEEMED UNSUITABLE CONSISTENT WITH THE EARTHWORK SPECIFICATION 1.04.B. WILL NOT BE USED. BACKFILL WILL BE PLACED IN LIFTS CONSISTENT WITH THE EARTHWORKS SPECIFICATION 3.12.B.4.
9. FLEXIBLE COUPLINGS SHALL BE FLEXJOINT COUPLING AS MANUFACTURED BY ETHYLENE, LLC OR EQUAL. FLEXIBLE COUPLINGS SHALL HAVE A MINIMUM OF (2) BELLOWS AND BE TEFLON-LINED WITH 316 SS FLANGES (POWER BAKED EPOXY COATING APPLIED) AND VITON CASKETS.

**FINAL DCB 007.4 – SA-6 SOUTH CGWES**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 007.4 **DCB Type:** Major(a)<br>**Effective Date:** 9/3/15; **Rev. 1** |
| **Project Location:** SA-6 | **Associated RFI:** |
| **Title:** GW Extraction System – Revisions of Electrical to Replace Wells with Trenches | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description:**

DCB-007.1 was issued for the trench detail portion of the modified groundwater system design. At the time of issue details for the SA-6N trench were subject to potential further modification.

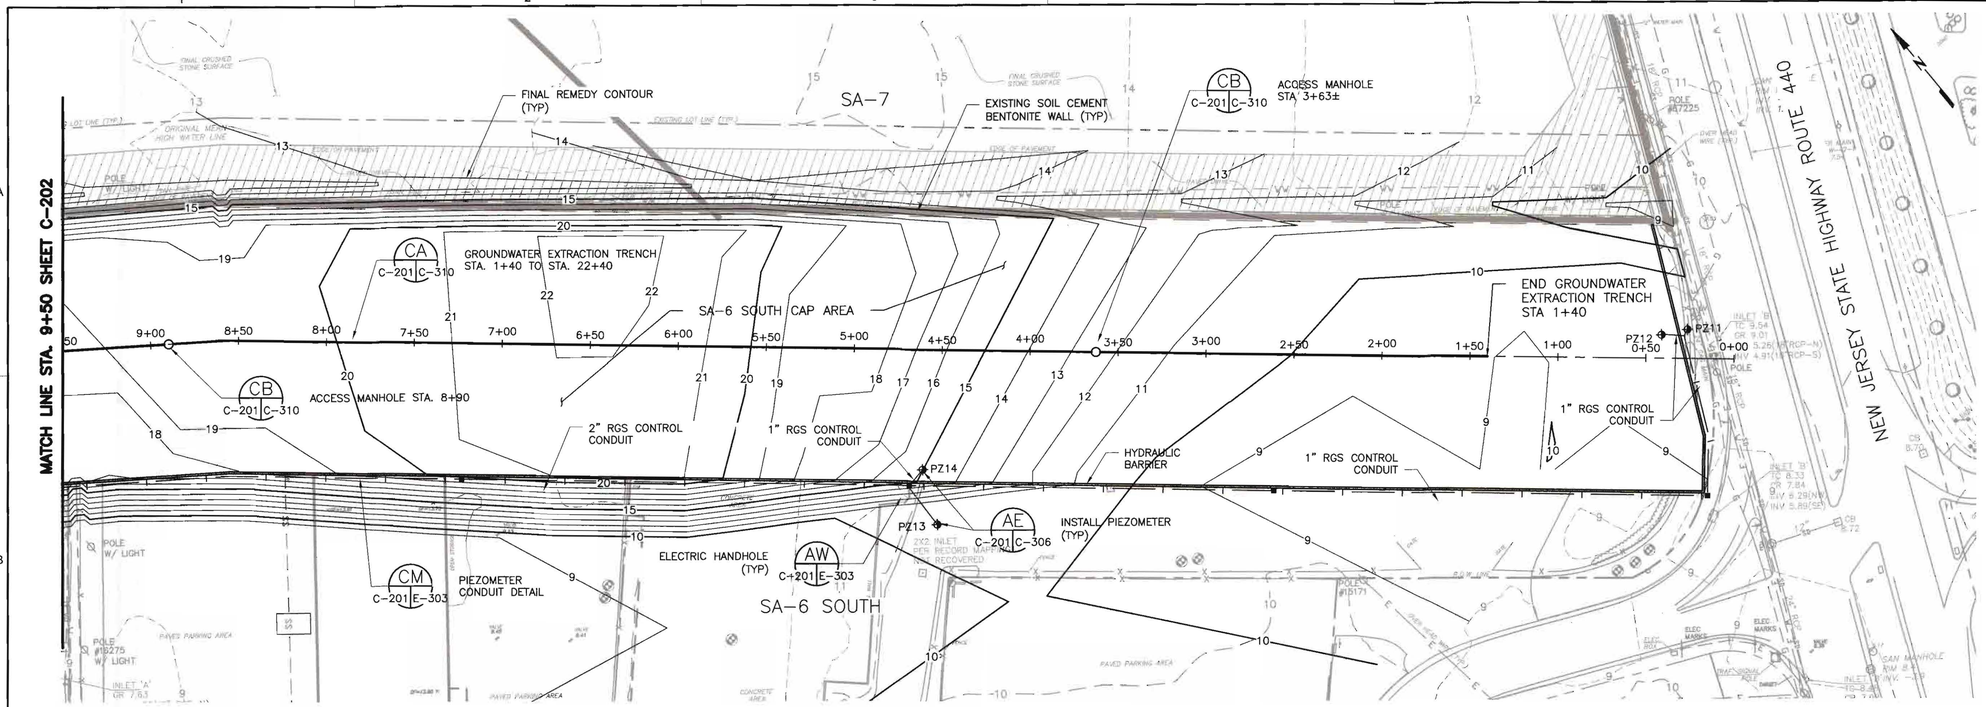
DCB-007.2 provided the final details for the SA-6N groundwater collection trenches and associated electrical supply and groundwater discharge piping.

DCB-007.3 provided the final details for the SA-6N groundwater collection trenches and associated electrical supply and groundwater discharge piping

DCB-007.4 provides the revised electrical plan, one line electrical drawings and electrical details for SA-6S.

The 100% Design included a Conceptual Design for the Groundwater Extraction system that was based on use of 9 extraction wells in each open space area and common header system. The revised Design uses a trench design. Details related to the Administrative basis for the change are provided in DCB 007.1.

DCB 007.4 is applicable to the Groundwater Extraction System electrical drawings for SA-6S (electrical plan and one line electrical drawing).



Drawings that are revised in this DCB are:
SA-6S

**FINAL DCB 007.4.1 – SA-6 SOUTH CGWES**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 7.4.1 **DCB Type:** Major(a)<br>**Effective Date:** 5/24/16 |
| **Project Location:** SA-6 South | **Associated RFI:** |
| **Title:** GW Extraction System – Revisions of Electrical to Replace Wells with Trenches | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description:**

DCB-007 series has documented changes to the contingent GW system design. Details related to the administrative basis for the change are provided in DCB 007.1 (issued to Entact on 6/12/14).

Several major changes have been issued in the past covering the change from Individual Wells to a Trench Drain system and the elimination of all wiring, pumps, and controls from the Entact Chromium Remedy scope of work.

This DCB 7.4.1 is being issued to address further changes in the SA-6 South design, including but not limited to:

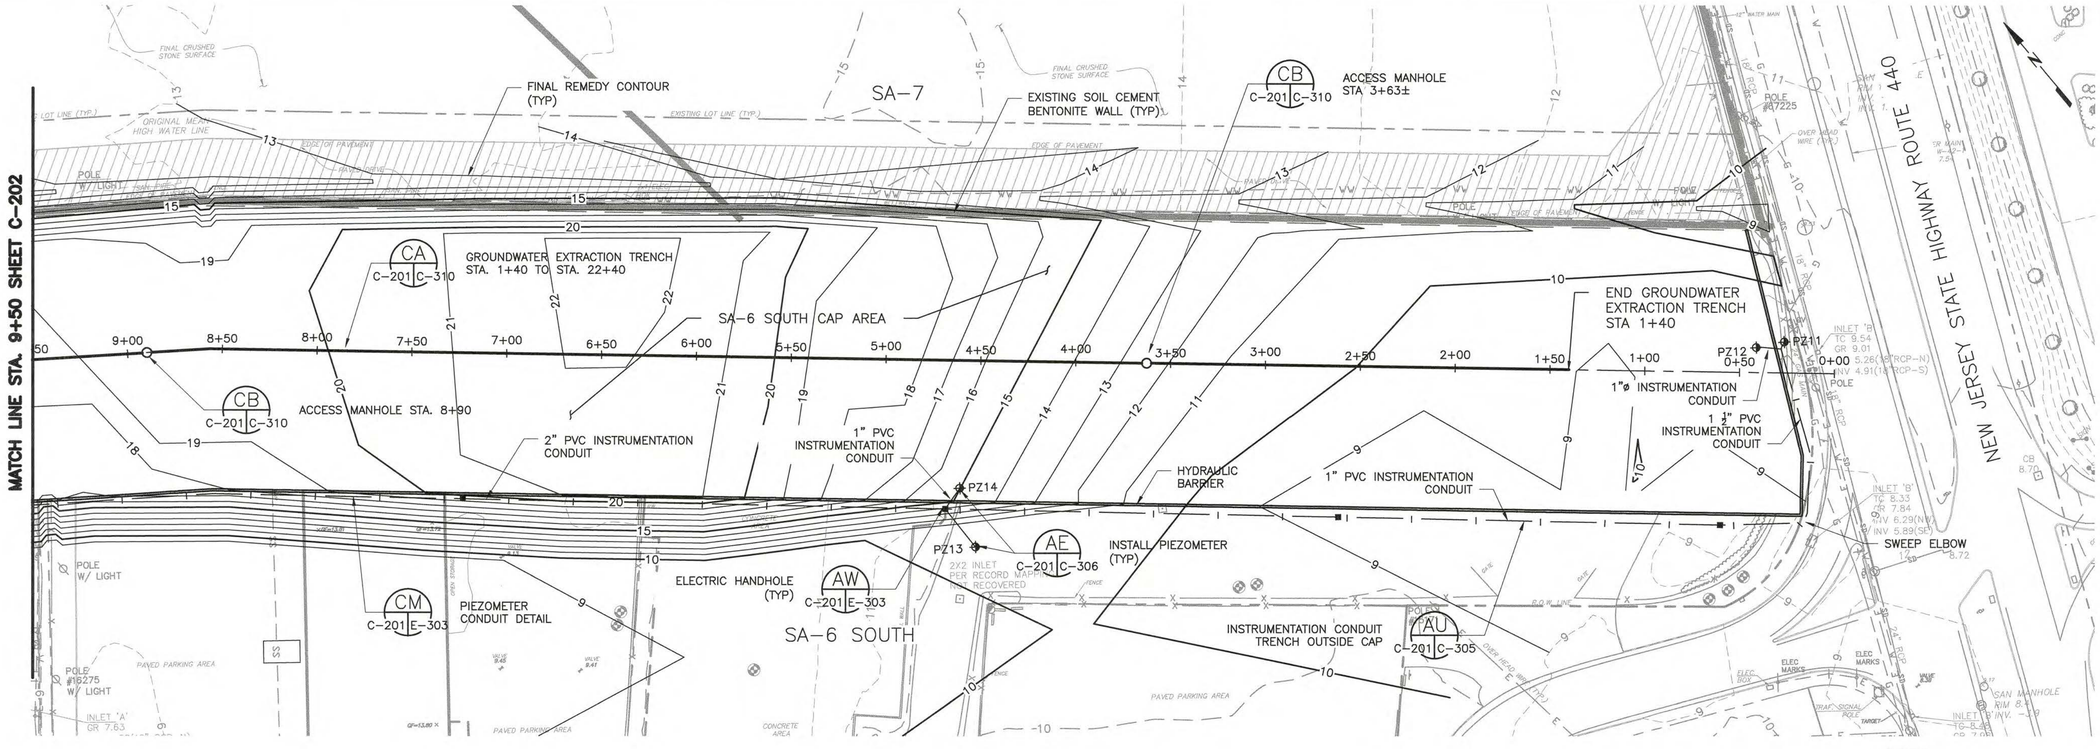
- Elimination of Drop Structure at the junction of SA-6 / SA7
- Elimination of flow meter
- Conduit sizing changes

Drawings that are revised in this DCB are:

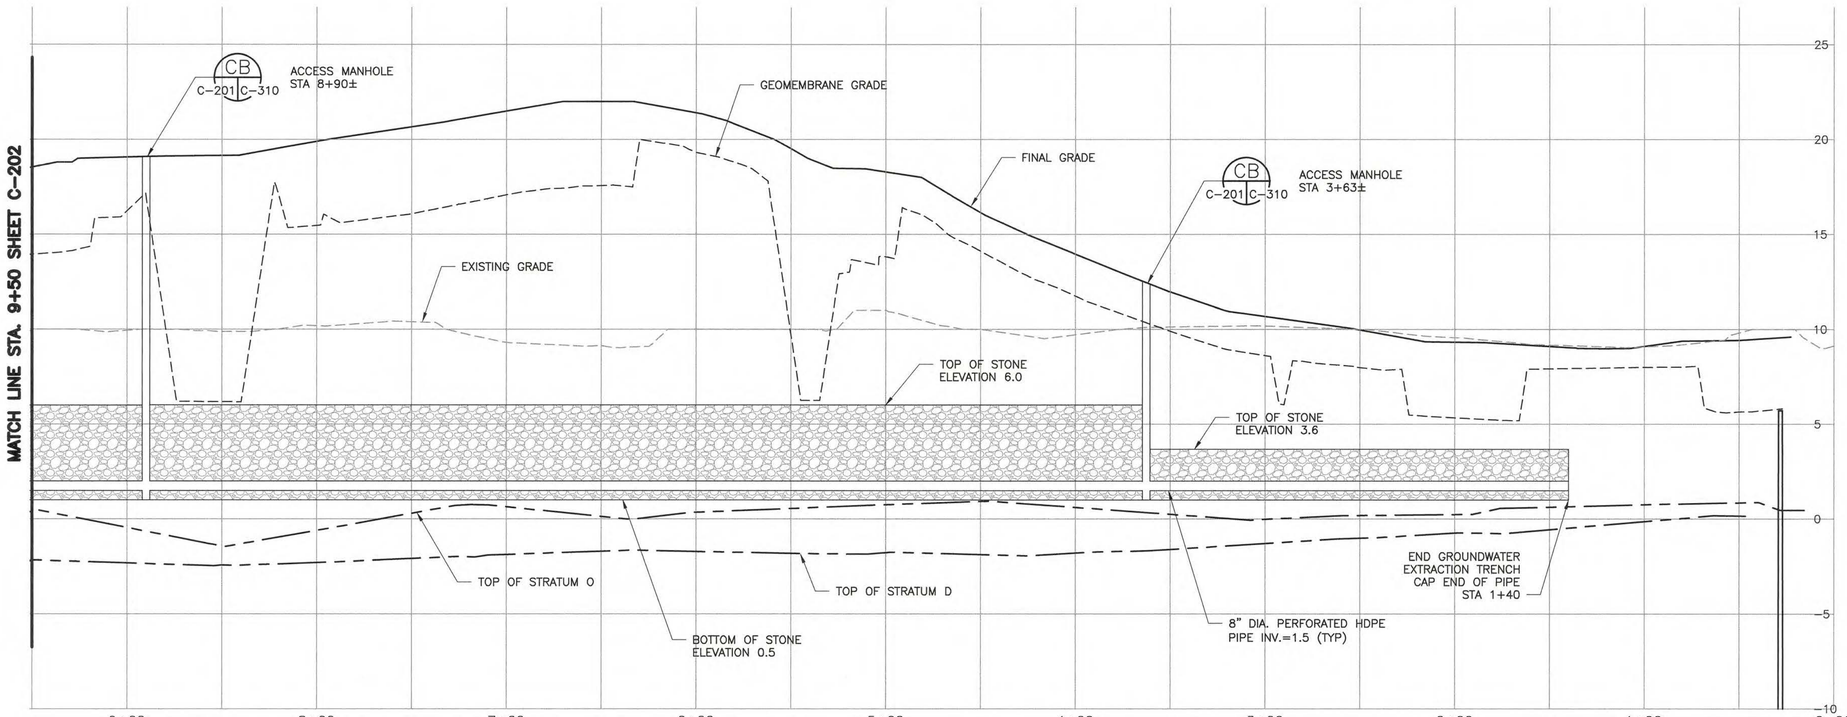
- C-201
- C-202
- C-203
- C-204
- C-304
- C-305
- C-306
- C-310
- E-301 (Not for Construction)
- E-302 (Not for Construction)
- E-303

**Clarification of Entact Scope of Work:**

- The provision of pumps, electrical wiring and instrumentation for the Contingent Groundwater system has been removed from Entact's scope of work.
- The installation of the FM and E&I conduits remain in Entact's scope, as depicted on the drawings.
- Running of conduit to the piezometers remains in Entact's scope. No instrumentation or wiring will be installed in the piezometers as part of the initial Chromium Remedy. The need and type of instrumentation will be determined based on the initial rounds and evaluation of the performance of the Contingent System.
- All E&I conduit will be, at a minimum, Sched 40 PVC meeting the National Electric Code.



**Clarification of Entact Scope of Work (continued):**



- SA-6/7 Meter / Drop structure has been eliminated and replaced with two 45 degree transitions. This detail needs to be reviewed with the fabricator and details shall be submitted to the engineer for approval.
- In the SA-6S east end, AmecFW had to relocate the last pull box and build in some bends. Therefore, the conduit was increased to 1.5 inch.
- The revised design calls for a minimum 24" of cover for direct burial of conduit.
- The E&I conduit from SA-7 to the SA-6S Pump Station is now shown as concrete encased (location shown on Drawing C-203, Detail AA shown on C-305).

DCB 7.2.2 will document changes to the SA-6 North Contingent GW Extraction system. DCB 7.2.2 will follow in a separate submittal.

| | |
|---|---|
| **Reason for Change/Modification:**<br>☐ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other | **Explanation or Reason:** : Design changed due to changes in the recovery concept, permitted discharge location and site grading |
| | **Attachments:** ☑ Yes ☐ No<br>C-201, C-202, C-203, C-204, C-304, C-305, C-306, C-310, E-301 (Not IFC), E-302 (Not IFC), E-303 |
| | Cost Implication: ☑ Yes ☐ No<br>>$50k ☑ Yes ☐ No<br>Schedule Implication ☐ Yes ☑ No |
| **Additional Comments:** | **Design Documents Affected:**<br>C-201, C-202, C-203, C-204, C-304, C-305, C-306, C-310, E-301 (Not IFC), E-302 (Not IFC), E-303 |
| **Honeywell (AP) Review:**<br>**Individual:** Geoff Shallard **Discipline:** EOR | **Initial:** [signature] **Date:** 5/24/16 |
| **(Name / Signature):** | **Does DCB Result in CCO?** ☑ **Yes (b)** ☐ **No**<br>**Date:** |
| **Distribution:** | |

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval
(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

## NOTES:

1. REFER TO GENERAL NOTES SHEET G-003 AND G-004.
2. REFER TO LEGEND AND ABBREVIATIONS SHEET G-002
3. DEWATER AS NECESSARY TO PROVIDE SUITABLE CONDITIONS FOR PLACEMENT OF STONE AND HDPE PIPE.
4. USE SHEETING/SHORING TRENCH BOXES OR OTHER MEANS AS NECESSARY TO ALLOW FOR PLACEMENT OF FILTER STONE AND HDPE PIPE.
5. FINAL PLAN VIEW ALIGNMENT MAY BE ADJUSTED SUBJECT TO THE APPROVAL OF THE ENGINEER TO AVOID OBSTRUCTIONS SUCH AS EXISTING BUILDING FOUNDATIONS, ABANDONED UTILITIES AND PILES.
6. TRENCH INVERT HAS BEEN DESIGNED TO BE ABOVE STRATUM O AND STRATUM D. INVERTS MAY BE ADJUSTED DURING DESIGN DEVELOPMENT OR IN RESPONSE TO OBSERVED FIELD CONDITIONS SUBJECT TO THE APPROVAL OF THE ENGINEER AND GROUNDWATER MODELER.
7. PLACE STONE LOOSE IN GROUNDWATER COLLECTION TRENCH. RUN PLATE COMPACTOR OR EQUAL OVER TRENCH PRIOR TO INSTALLING GEOTEXTILE FABRIC.
8. BACKFILL ABOVE GEOTEXTILE FABRIC MAY BE COMPOSED OF EXCAVATED TRENCH SPOIL OR OTHER MATERIAL THAT CAN BE READILY COMPACTED. WET SOIL OVERSIZED DEBRIS OR OTHER MATERIALS AS DEEMED UNSUITABLE CONSISTENT WITH THE EARTHWORK SPECIFICATION 1.04.B. WILL NOT BE USED. BACKFILL WILL BE PLACED IN LIFTS CONSISTENT WITH THE EARTHWORKS SPECIFICATION 3.12.B.4.
9. FLEXIBLE COUPLINGS SHALL BE FLEXJOINT COUPLING AS MANUFACTURED BY ETHYLENE, LLC OR EQUAL. FLEXIBLE COUPLINGS SHALL HAVE A MINIMUM OF (2) BELLOWS AND BE TEFLON-LINED WITH 316 SS FLANGES (POWER BAKED EPOXY COATING APPLIED) AND VITON CASKETS.
10. INSTALL INSTRUMENTATION CONDUIT FOR PAIRED PIEZOMETERS READIED WITH PULL STRINGS FOR FUTURE INSTRUMENTATION CABLE INSTALLED BY OTHERS.
11. CONCRETE ENCASEMENT REQUIRED IF BURIAL DEPTH IS LESS THAN 24" OR OTHERWISE NOTED FOR E&I CONDUIT.

**FINAL DCB 007.4.2 – EI REVISIONS CONTINGENT GROUNDWATER**

DESIGN CHANGE BULLETIN

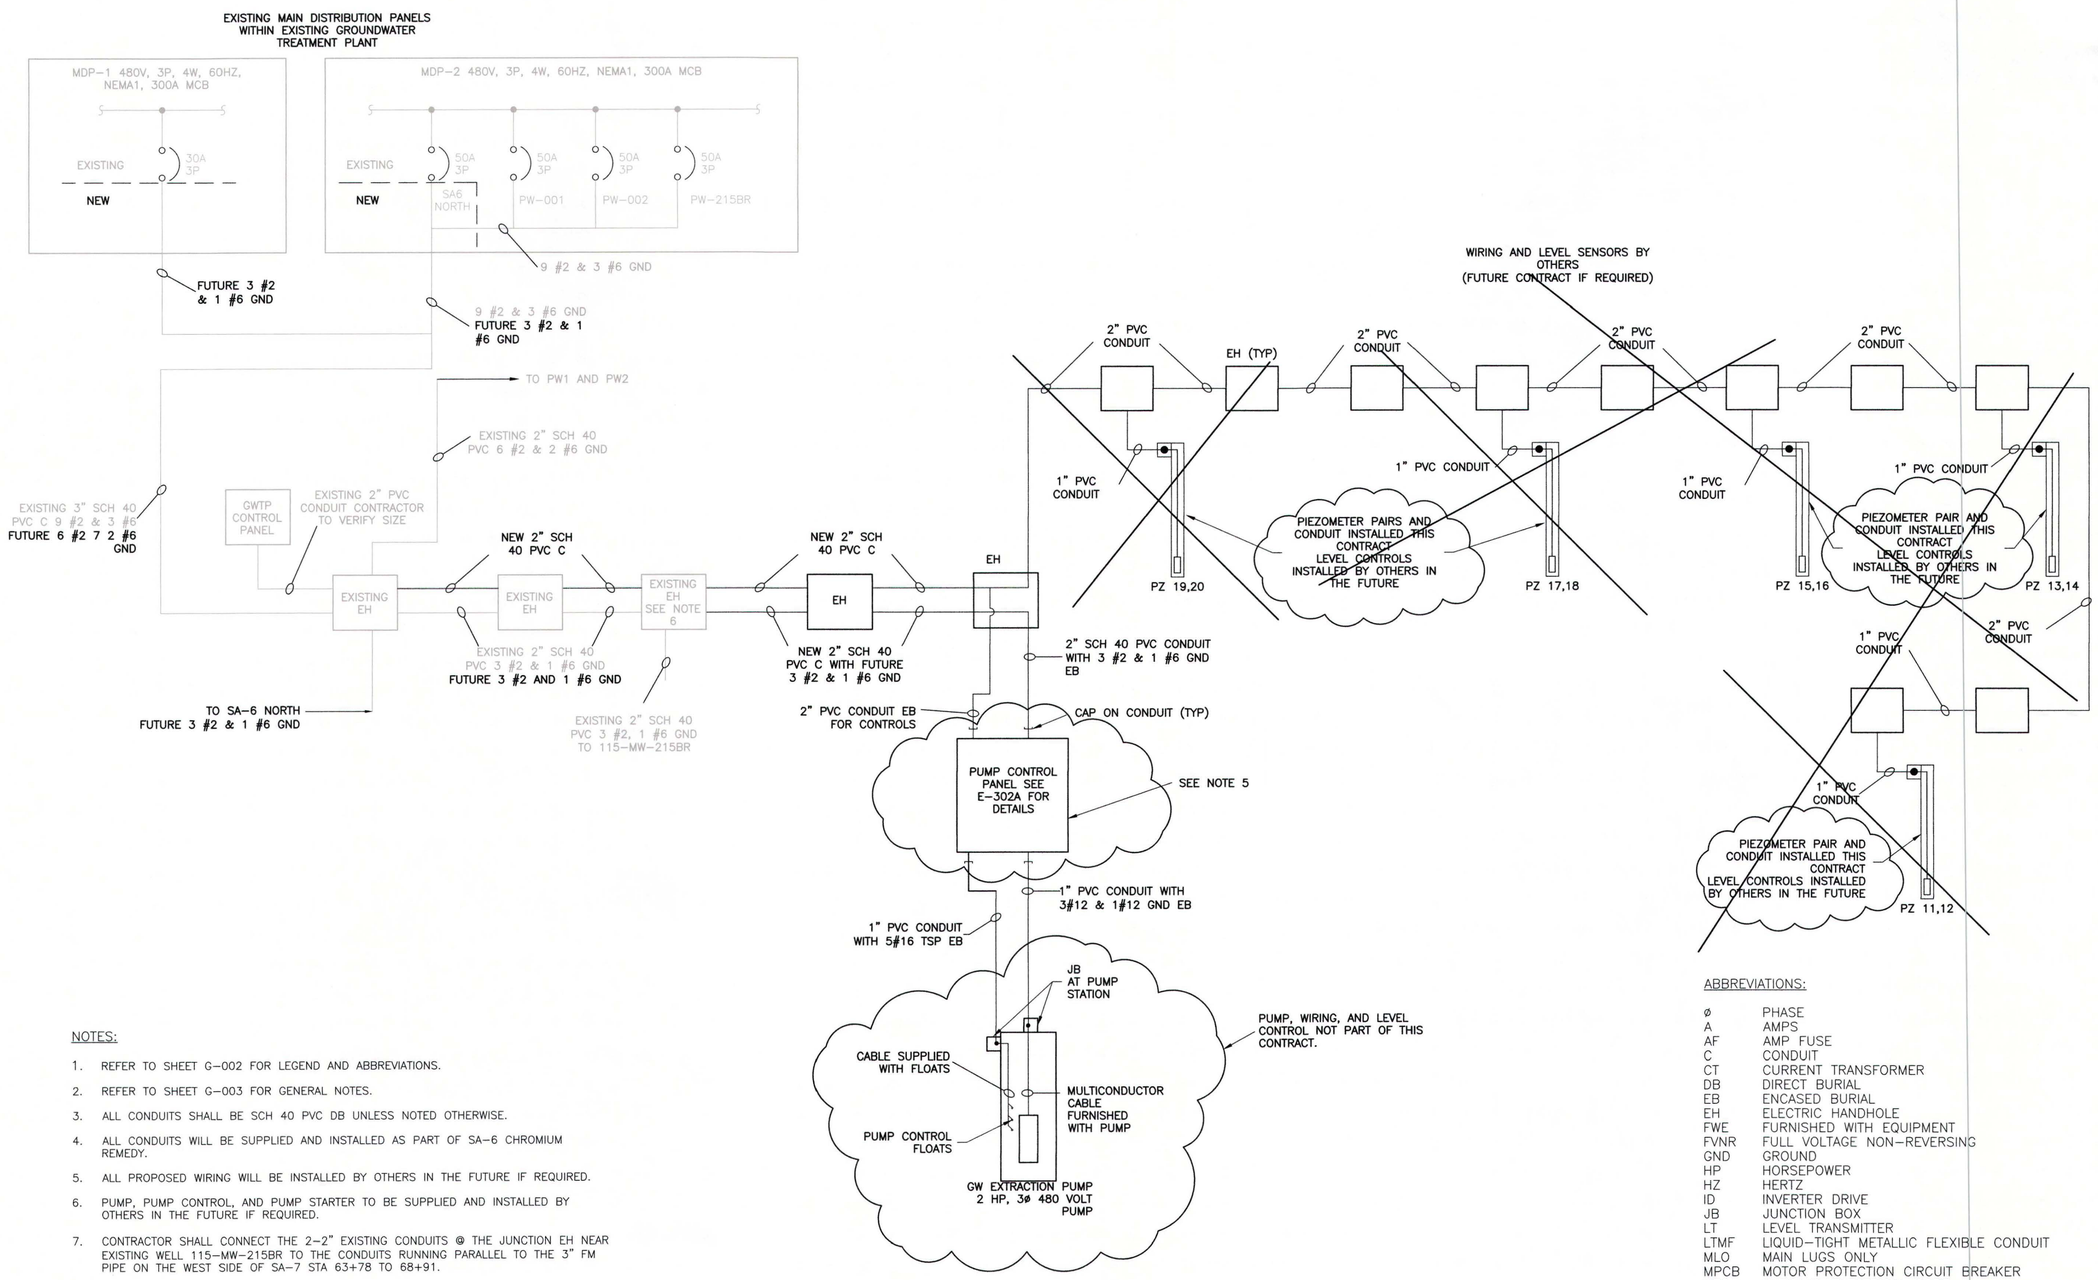
| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** DCB 7.4.2 **Type:** Minor(a)<br>**Effective Date:** 12/20/2016 |
| **Project Location:** SA-6 North and South | **Associated RFI:** |
| **Title:** Contingent GW E&I Revisions | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.** The Contingent GW system was modified from wells to trenches. This resulted in a reduction in from 9 pumps on the North, and 9 pumps on the South, to 2 pump stations on North, and 1 pump station on South. The electrical and instrumentation (E&I) requirements and associated conduit runs changed accordingly.

This DCB documents a number of minor field changes that have been conveyed by the EOR to Entact during the course of the work and also includes revisions to the (E series) electrical drawings for both SA-6N and SA-6S.

The IFC conduit runs were designed to allow for hard wiring of the piezometric pairs used to monitor the gradients. The piezometric instrumentation conduit run has been eliminated on SA-6S. The piezometric pairs will initially be monitored manually. Manual monitoring may be supplemented by use of data loggers (Solinst Levelogger or similar) in selected wells. Based on the technical advancement in data loggers subsequent to the IFC design, data collection options that do not require hard wiring are a viable and preferred. Wireless data loggers eliminate the risk of damage and associated subsurface repair in the future. As a result, conduit runs for the piezometers were deleted from SA-6S. Due to the progress of work and scheduling, a piezometer conduit was installed on SA-6N; however, wiring has not been installed and it is the engineer's recommendation that wireless installation be used.

Investigation of existing conduit runs at the west end of SA-7 indicated that one 2-inch conduit shown on the IFC design as existing was not present. A new conduit run was added in its place.



All pump stations, force-mains and E&I conduit runs except as noted above have been installed.

The reason for considering this a "Contingent" System is that modeling predictions indicate that **no pumping** will be required i.e. there is no technical design basis for determining a flow rate. In the absence of a theoretical or verified design flow the forcemains have been sized at 2 inches in diameter and the pumps and associated wiring to operate at 5 GPM. Larger pumps and wire sizes could be readily installed in the unlikely event they are required. As of the date of issue of this DCB, pumping has not been required. This covers a period of more than 12 months on SA-6S, and 4 months on SA-6N. To provide an allowance for pumping at some nominal flow rate, pumps and power have been sized assuming a steady 5 GPM flow rate. The pump and controls design is based on operation of only one pump station at a time. The 5 GPM is based on the capacity of the existing GWTP effluent pumps. The forcemain and pumps have been sized for greater capacity, and greater flows could be readily achieved, if the effluent pump capacity was increased. It is recommended that a final decision on pump sizes, and related wiring and instrumentation, be revisited if it is determined that pumping is required. The GWTP has been modified under separate contract with BSTI to accommodate the flow and E&I controls.

NOTE:

THE WIRE SIZING AND CONFIGURATION SHOWN IS BASED ON INFORMATION AVAILABLE AS OF DECEMBER 2016. IF IT IS DETERMINED THAT IT IS NECESSARY TO ACTIVATE THE CONTINGENT GROUNDWATER SYSTEM, PUMP SIZING AND CONTROLS SHOULD BE RE-EVALUATED BASED ON THE PROJECTED PUMPING RATES AND DURATION DETERMINED AT THAT TIME. PUMPS, CONDUITS AND WIRE HAVE BEEN SIZED CONSERVATIVELY. HEAVIER WIRE AND LARGER PUMPS COULD BE INSTALLED IN THE EXISTING CONDUIT IN THE EVENT IT WAS DEEMED NECESSARY.

**FINAL DCB 007.5 – CONTINGENT SYSTEM**

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 007.5 Major<br>Effective Date: 02/24/15 |
| Project Location: SA-6 SOUTH | |
| Title: GW EXTRACTION SYSTEM | |
| Revision to the Geomembrane/Subgrade surface. | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

DCB-007.1 was issued for the trench detail portion of the modified groundwater system design. At the time of issue details for the SA-6N trench were subject to potential further modification.

DCB-007.2 provided the final details for the SA-6N groundwater collection trenches and associated electrical supply and groundwater discharge piping.

DCB-007.3 provided the final details for the SA-6S groundwater collection trenches and associated electrical supply and groundwater discharge piping

DCB-007.4 issue pending. This DCB will provide the revised one line electrical drawings for SA-6N and SA-6S. In the revised design there is one extraction manhole on SA-6S and two extraction manholes in SA-6N.

DCB-007.5 provides a revised subgrade/Geomembrane surface as discussed below.

The 100% Design included a Conceptual Design for the Groundwater Extraction system that was based on use of 9 extraction wells in each Open Space Area and common header system. The trench design has one pump station in SA-6S and 2 pump stations in SA-6N.

Details related to the Administrative basis for the change are provided in DCB 007.1.

DCB 007.5 is applicable to the SA-6N and SA-6S subgrade/Geomembrane surface. The change from wells to trenches resulted in numerous changes in grading. There were typically depression in the subgrade around each well to allow for installation of control vaults at each well and associated force mains leading from each well. These depressions have been eliminated and the Geomembrane surface smoothed at these locations. A depressed area has been added at each pump station and associated force main. The changes simplify the grading and Geomembrane installation

The changes impact the following drawings.
For 6A-South:

- C-122
- C-123
- C-124

For 6A-North:

- CN-123
- CN-124

| | |

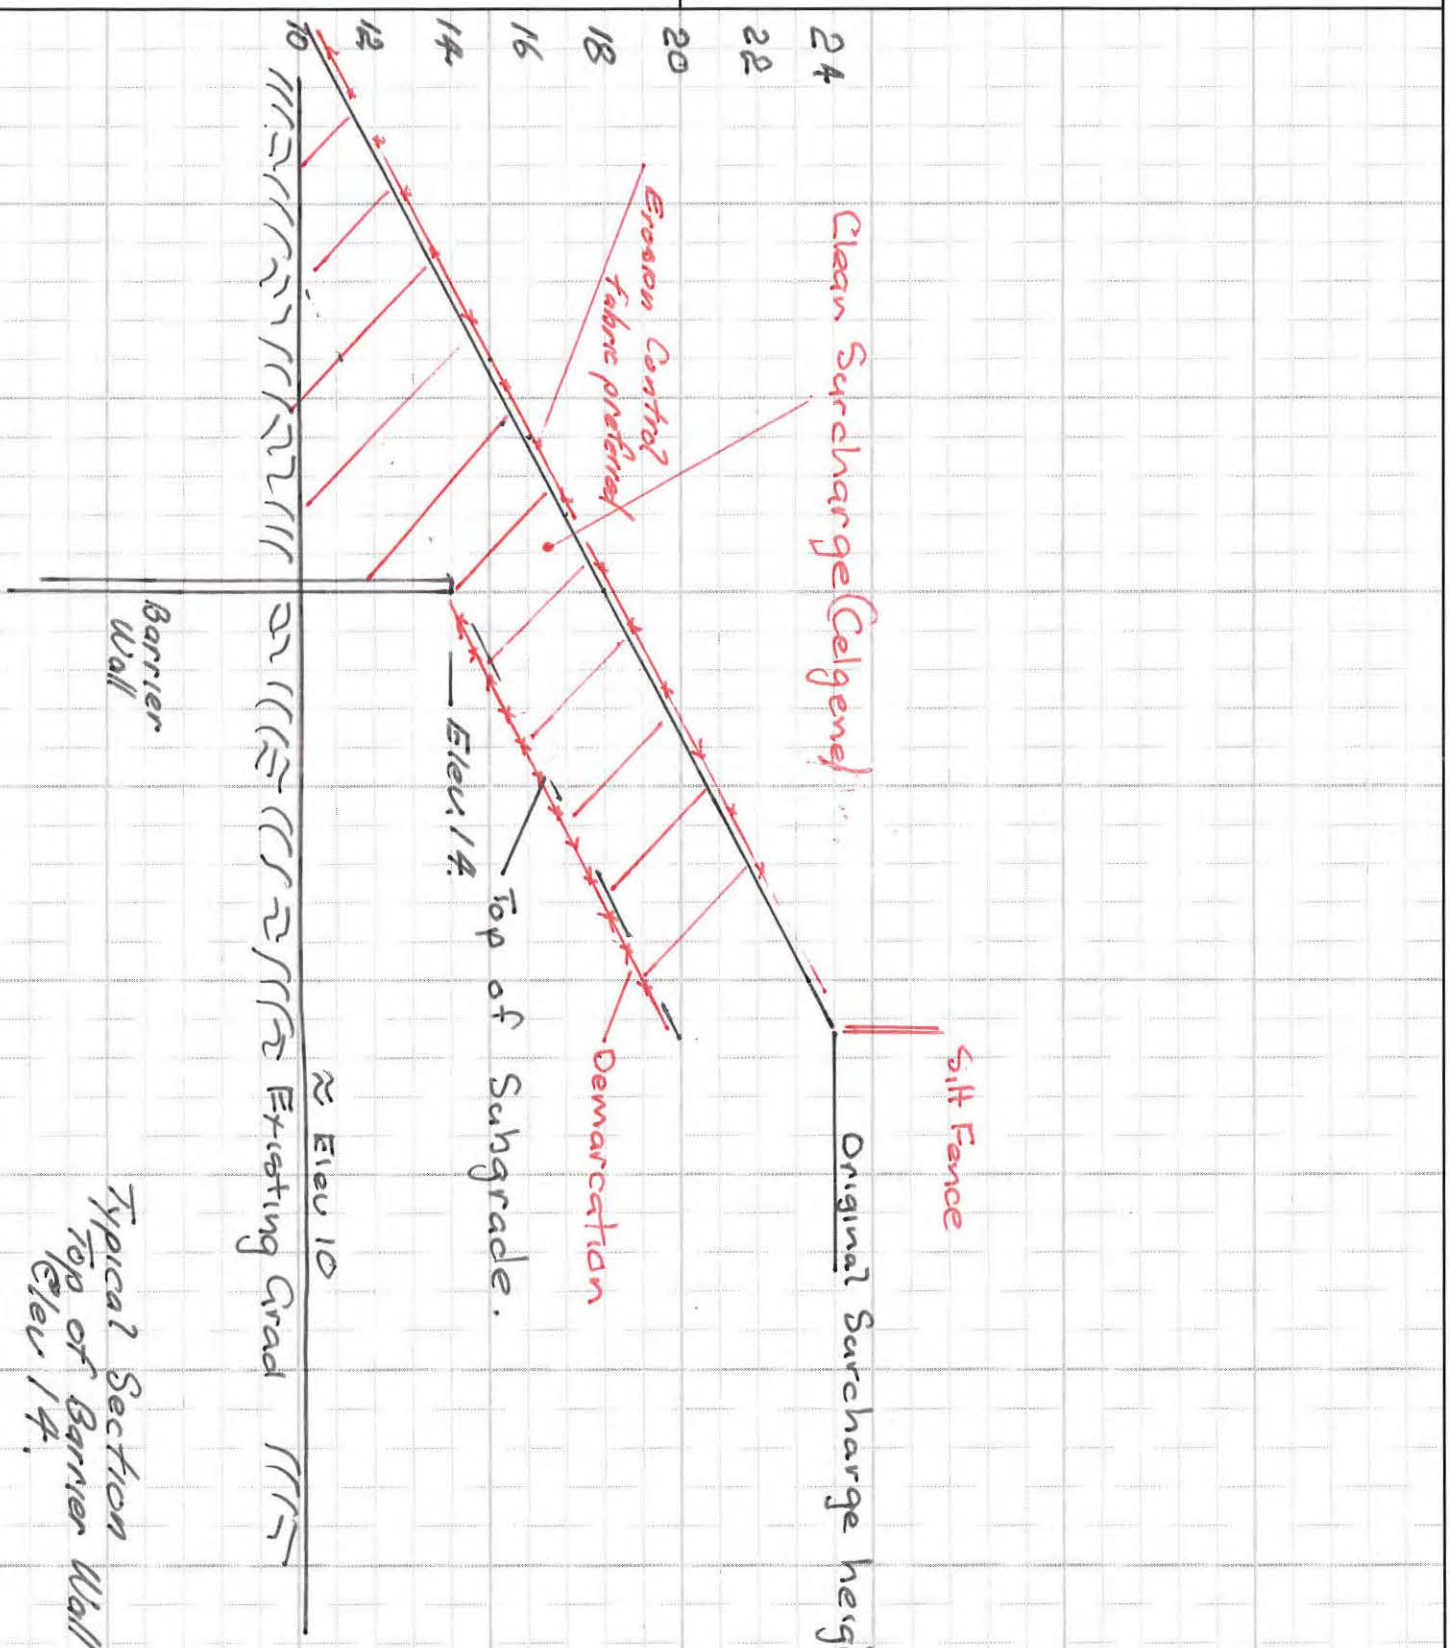
DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 008.1 Major (a)<br>Effective Date: 8/14/13 |
| Project Location: SA-6 NORTH<br>Title: 1S Surcharge Pile Geometry | Associated RFI:<br>☐ Yes, RFI No. ___ ☑ None |
| Contractor (Subcontractor): Entact | Project No.: 3480130377 |

Description of Change/Modification:
Due to decisions to defer shallow excavation adjacent to the bulkhead, Amec has made a minor modification in the surcharge pile geometry and final grading geometry along the western edge of Area S1 to reduce the re-work that will be required when the bulkhead is completed and the deferred area remediated.

DCB-008 will be issued in two sections
DCB-008.1 Surcharge Pile Revisions
DCN-008.2 Subgrade and Final Grading

DCB-008.1 The crest of the surcharge (elevation 24) is being moved approximately 16 ft. to the east of the Barrier Wall.
The top of the Barrier Wall "as installed" steps from elevation 14 to elevation 16.
Where the Barrier wall is at elevation 14 the toe of slope will extend beyond the wall as shown in Figure 1.
Where the Barrier Wall is at elevation 16 the toe will terminate at the Barrier Wall.
It is anticipated that displacement will be seen at the inclinometers. It is also anticipated that the rate of fill placement will be limited within 75 ft. of the Barrier Wall by displacement at the inclinometers. It is considered likely that filling from elevation 13 to elevation 16 may take a week or more between lifts.
All materials placed outside the Barrier Wall will be imported clean surcharge fill. A placement plan should be developed for the toe between the bulkhead and Barrier Wall to minimize equipment loading on the bulkhead. At a minimum the top 12 inches of the constructed pile will be "imported surcharge"
The west face of the slope will be covered with erosion control fabric.



| | |
|---|---|
| Reason for Change/Modification:<br>☐ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | Explanation or Reason<br>Reduce construction loads on the existing bulkhead pending bulkhead improvements. Minimize re-work in the "deferred area".<br>Attachments: ☑ Yes ☐ No<br>Cost Implication: ☐Yes ☑ No<br>>$50k ☐ Yes ☐ No<br>Schedule Implication ☐ Yes ☑ No |
| Additional Comments: Major DCB anticipated, requires review and approval by third parties. | Design Documents Affected:<br>Drawings<br>C 108 Rev 2 |

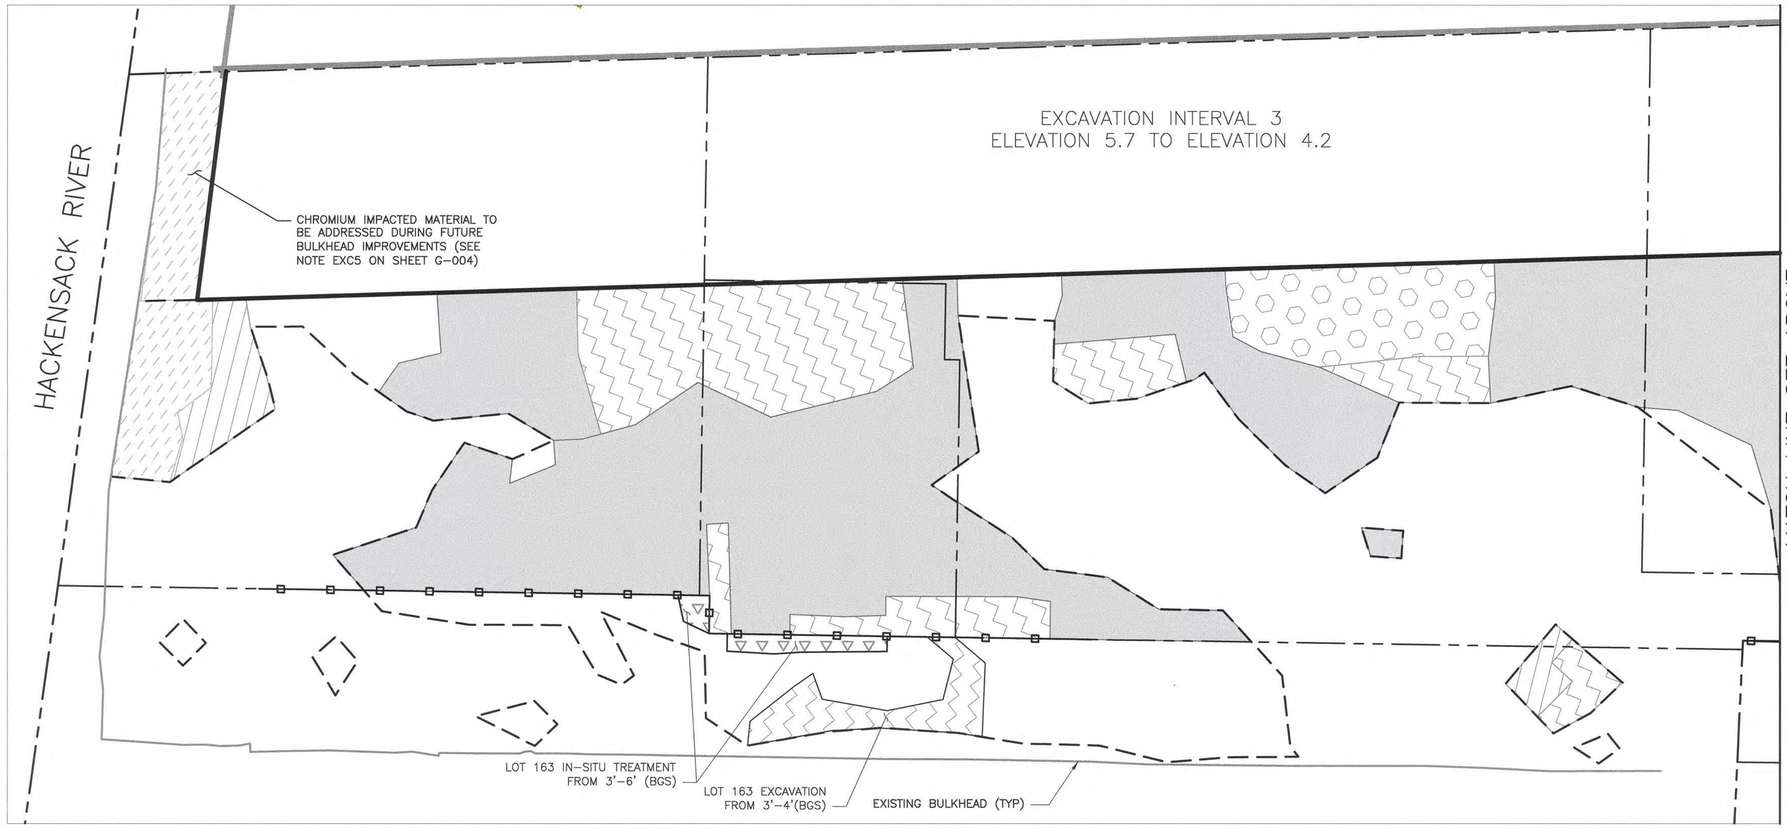
**FINAL DCB 009 – SITE 163 EXCAVATION**

**DESIGN CHANGE BULLETIN**

| | |
|---|---|
| **Project Name: Chromium Remedy Study Area 6, Jersey City, New Jersey** | **DCB No.: 009, Minor(a)**<br>**Effective Date: 7/28/14** |
| **Project Location: SA-6 North & South** | **Associated RFI:** |
| **Title: Site 163 Excavation** | ☐ Yes, RFI No. _____ ☒ None |
| **Contractor (*Subcontractor*): ENTACT** | **Project No.: 3480130377** |

**Description of Change/Modification:**



In lieu of in-situ treatment of an area of soil from 3 to 4 feet below grade on Site 163, Entact will now excavate those soils pre-characterized as 20-240 mg/kg for hexavalent chromium and consolidate the soils in the Open Space AOC. The area shown on revised Drawing C-114. This is a change from excavating only to 3 ft bgs as stipulated in the 100% Design. Volume of additional pre-characterized 20 – 240 mg/kg soil generated in this area is estimated to be 155 CYs.

| | |
|---|---|
| **Reason for Change/Modification:**<br>☐ Unforeseen or Differing Site Conditions<br>☒ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | **Explanation or Reason:**<br>Increase depth of excavation in one area at Site 163<br>**Attachments:** ☒ Yes ☐ No<br>**Cost Implication:** ☐ Yes ☒ No<br>**>$50K** ☐ Yes ☒ No<br>**Schedule Impact** ☐ Yes ☒ No |

| **Contractor (*Subcontractor*): ENTACT** | **Project No.: 3480130377** |

**Description of Change/Modification:**

Honeywell will defer all excavation in the area shown on the attached **Figure 1**. This area includes a portion of Cell 153 and Cell 154 through Cell 156 in their entirety (see Photo 1). This design change is necessary due to unanticipated subsurface conditions. Approximately 5 feet of concrete was encountered in the subgrade of this area during excavation in Cell 153 (see cross-section A-A'). The concrete was also observed to have flowed around structural elements of the bulkhead. Demolition of the concrete to facilitate the excavation as shown on the Issued for Construction Design posed an unacceptably high potential for damage and loss of integrity to the bulkhead in this area (see Photo 2). Therefore, removal of the concrete/asphalt berm, demolition of subsurface concrete, and excavation to the specified design elevations will be deferred until implementation of the bulkhead portion of the Bayfront Redevelopment Plan.
Note Exc. 10 on sheet C-104 should be hand annotated as deleted. A new sheet C-104 will not be issued.

## LEGEND

- HEXAVALENT CHROMIUM SOIL CONTAMINATION UNDER 20 PPM
- HEXAVALENT CHROMIUM SOIL CONTAMINATION BETWEEN 20-240 PPM
- HEXAVALENT CHROMIUM SOIL CONTAMINATION OVER 240 PPM
- HEXAVALENT CHROMIUM SOIL CONTAMINATION OVER 1000 PPM
- AREAS OF IN-SITU TREATMENT BELOW 3 FEET
- NO EXCAVATION REQUIRED
- DEFERRED AREA

NOTES:

1. REFER TO GENERAL NOTES SHEET G-003 AND G-004.
2. REFER TO LEGEND AND ABBREVIATIONS SHEET G-002.

NOTE: EXCAVATION IS INTENDED TO TERMINATE AT TOP OF STRATUM D LAYER IF ENCOUNTERED. CONTRACTOR SHALL REVIEW PROJECT BORING LOGS TO VERIFY ANTICIPATED TOP OF STRATUM D ELEVATIONS. CONTRACTOR MAY BE REQUIRED TO REMOVE UP TO 6-INCHES OF STRATUM D BASED ON DIRECTION OF THE ENGINEER.

**FINAL DCB 011 – MWAP REVISED TABLES**

## DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name: Chromium Remedy Study Area 6, Jersey City, New Jersey** | **DCB No.: 011, Minor(a)**<br>**Effective Date: 7/28/14** |
| **Project Location: SA-6 North & South** | **Associated RFI:**<br>☐ Yes, RFI No. _____ ☒ None |
| **Title: Revised Monitoring Well Abandonment Plan Tables** | **Project No.: 3480130377** |
| **Contractor (*Subcontractor*): ENTACT** | |

**Description of Change/Modification:**

Revised tables of wells to be abandoned and retained are provided. The designation (abandon/retain) of several wells has been modified to accommodate the changing site conditions and future work at the site.

| | |
|---|---|
| **Reason for Change/Modification:**<br>☐ Unforeseen or Differing Site Conditions<br>☒ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | **Explanation or Reason:**<br>Clarify well abandonment requirements<br>**Attachments:** ☒ Yes ☐ No<br>**Cost Implication:** ☐ Yes ☒ No<br>**>$50K** ☐ Yes ☒ No<br>**Schedule Impact** ☐ Yes ☒ No |
| **Additional Comments:** | **Design Documents Affected:**<br>Appendix A-2, Monitoring Well Abandonment Plan Tables |
| **Honeywell (AP) Review:**<br>**Individual: Geoff Shallard Discipline: EOR** | **Initial** GS **Date** 7/30/14 |
| **(Name / Signature):** | **Does DCB Result in CCO?** ☐ Yes (b) ☒ No<br>**Date** |

**Distribution: Caroline Panico, ENTACT; Adam Ewert, ENTACT; Keith Goisse, ENTACT; Kurt Gimbel, ENTACT; Dennis Nagg, Amec; Stuart Bills, Amec; David Ambrose, Amec**

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval.
(b) – If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

**TABLE 1a**
**PROPOSED SHALLOW ZONE WELLS**
**FOR ABANDONMENT / RETAINMENT**

**Added to list of wells to be abandoned**
**Removed from list of wells to be abandoned**

| Study Area | Site | Well | Abandon / Retain | Related Monitoring Program | Reason to Retain |

**FINAL DCB 012 – HYDROCARBON SOILS IN CAP**

**DESIGN CHANGE BULLETIN**

| | |
|---|---|
| **Project Name: Chromium Remedy Study Area 6, Jersey City, New Jersey** | **DCB No.: 012, Minor(a)**<br>**Effective Date: 10/28/14** |
| **Project Location: SA-6 North & South** | **Associated RFI:** |
| **Title: Hydrocarbon Soils in Cap Area** | ☐ Yes, RFI No. _____ ☒ None |
| **Contractor (*Subcontractor*): ENTACT** | **Project No.: 3480130377** |

**Description of Change/Modification:**

Hydrocarbon-impacted soils have been identified based on odor and PID readings as being co-mingled with the chromium-impacted soil in the SA-6 South chromium excavation. Hydrocarbon-impacted soil will be stockpiled separately from the non-hydrocarbon-impacted soil. Stockpiles will be sampled and analyzed for characterization as described in correspondence with NJDEP. It was determined that some of the hydrocarbon-impacted soil containing elevated levels of VOCs were to be disposed offsite, but certain other of hydrocarbon-impacted soil could be consolidated within the SA-6 South Open Space Area as long as the soil meets all other applicable reuse requirements of the Soil Management Plan (Appendix G – SA-6 North 100% Design Report). Hydrocarbon soils approved by the Engineer for placement under the SA-6 South cap will be consolidated in defined areas.

Placement and consolidation of the identified hydrocarbon-impacted soil will be conducted according to Specification 02315 – Earthwork. To the extent possible, the hydrocarbon-impacted soil should be placed in the Open Space Area and covered with non-hydrocarbon-impacted, chromium-impacted soil prior to construction of the cap over the soils. The vertical and horizontal limits of these areas will be documented in the final remedial action report.

Placement of hydrocarbon soils within the SA-6 South Open Space AOC was approved by the Plaintiffs in an email dated June 19, 2014 and by the NJDEP in an email dated October 2, 2014.

**FINAL DCB 015 – ASPHALT AND CONCRETE UNDER CAP**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name: Chromium Remedy Study Area 6 Jersey City, NJ** | **DCB No: 015; DCB Type: Minor(a)** |
| | **Effective Date: 10/31/14** |
| **Project Location: SA-6 NORTH and SOUTH** | **Associated RFI:** |
| **Title: Asphalt / Concrete under the Cap** | ☐Yes, RFI No. ___ ☑ None |
| | **Project No.: 3480130377** |
| **Contractor (Subcontractor): ENTACT** | |

**Description of Change/Modification:**

Amec has revised the Soil Management Plan (Appendix G – SA-6 North 100% Design Report) to indicate that any asphalt or concrete that meets NJDEP reuse requirements or is granted a variance by the NJDEP may be reused onsite as backfill or placed underneath the cap.

Prior excavation on SA-6 South, sixteen (16) samples of the asphalt pavement were collected in-situ throughout the excavation footprint. Concentrations of arsenic in six (6) of the samples exceed the RDCSRS of 19 mg/kg for arsenic. Entact has removed the arsenic-impacted asphalt from the excavation area and stockpiled it in the cap area. Honeywell requested approval from NJDEP and Plaintiffs to consolidate the asphalt in either the SA-6 North or SA-6 South Open Space Areas, in lieu of disposing of the arsenic-impacted asphalt offsite. Placement of the arsenic-impacted asphalt in either the SA-6 North or SA-6 South Open Space Area was approved by the Plaintiffs in an email dated September 9, 2014 and by the NJDEP in an email dated October 15, 2014.

Therefore, Entact is hereby directed to consolidate the subject arsenic-impacted asphalt in either the SA-6 North or SA-6 South Open Space Areas in a footprint that does not exceed 44,000 SF and cover the asphalt with chromium-impacted soil prior to construction of the cap over the soils. The vertical and horizontal limits of these areas will be documented in the final remedial action report.

Placement and consolidation of concrete or asphalt underneath the cap will be conducted according to Specification 02315 – Earthwork.

| | |
|---|---|
| **Reason for Change/Modification:**<br>☐ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | **Explanation or Reason:** NJDEP variance required to place impacted asphalt and concrete under the cap |

| **(Name / Signature):** Samuel G. Shallard | **Does DCB Result in CCO?** ☐ Yes (b)☑ No<br>**Date:** |
| **Distribution: Caroline Panico, ENTACT; Adam Ewert, ENTACT; Keith Goisse, ENTACT; Kurt Gimbel, ENTACT; Dennis Nagg, Amec; Stuart Bills, Amec; David Ambrose, Amec** | |

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval
(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

All above grade demolition activities will be conducted by Jersey City entities or by others.

Concrete and asphalt will be characterized by sampling per NJDEP's procedure on "Guidance for Characterization of Concrete and Clean Material Certification for Recycling" for recycling purposes pursuant to N.J.A.C. 7:26A or for beneficial reuse onsite pursuant to N.J.A.C. 7:26-1.7(g). Concrete determined to meet NJDEP reuse requirements, or which is granted a variance by NJDEP to meet reuse requirements, may be reused onsite as backfill in excavations or placed under the cap. Asphalt determined to meet NJDEP reuse requirements, or which is granted a variance by NJDEP to meet reuse requirements, may be used as sub-grade fill under new asphalt paved areas or placed under the cap. Concrete and asphalt that do not meet these NJDEP reuse or variance requirements will be disposed of offsite.

## 2.4 SA-6 SOUTH CONSTRUCTION DEBRIS MANAGEMENT

Asphalt and concrete removal at SA-6 South will be as shown on the Chromium Remedy Design Drawings. All concrete and asphalt materials will be managed in accordance with Section 02220 of the Technical Specifications. Honeywell has or is in the process of implementing demolition of building superstructures at SA-6 South prior to the implementation of the remedial actions. All buildings have been or will be demolished to their concrete slab foundations. All aboveground superstructure materials (concrete, steel, wood, etc) have or will be disposed of offsite. To the extent possible, any remaining concrete, asphalt and steel materials that do not interfere with remedial construction will be left in place. Concrete and asphalt will be generated during the remedial process from the following areas:

- Paved surfaces within the SA-6 South Open Space Area; and
- Paved surfaces and building slabs within the excavation areas within the SA-6 South Development Area.

Concrete and asphalt will be characterized by sampling per NJDEP's procedure on "Guidance for Characterization of Concrete and Clean Material Certification for Recycling" for recycling purposes pursuant to N.J.A.C. 7:26A or for beneficial reuse onsite pursuant to N.J.A.C. 7:26-1.7(g). Concrete determined to meet NJDEP reuse requirements, or which is granted a variance by NJDEP to meet reuse requirements, may be reused onsite as backfill in excavations or placed under the cap. Asphalt

determined to meet NJDEP reuse requirements, or which is granted a variance by NJDEP to meet reuse requirements, may be used as sub-grade fill under new asphalt paved areas or placed under the cap. Concrete and asphalt that do not meet these NJDEP reuse or variance requirements will be disposed of offsite.

**FINAL DCB 016 – SITE 163 RESTORATION**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name: Chromium Remedy Study Area 6 Jersey City, NJ** | **DCB No: 016; DCB Type: Minor(a)** |
| | **Effective Date: 12/01/14** |
| **Project Location: SA-6 NORTH and SOUTH** | **Associated RFI:** |
| **Title: Site 163 Backfill Protection** | ☐Yes, RFI No. ____ ☑ None |
| | **Project No.: 3480130377** |
| **Contractor (Subcontractor): ENTACT** | |

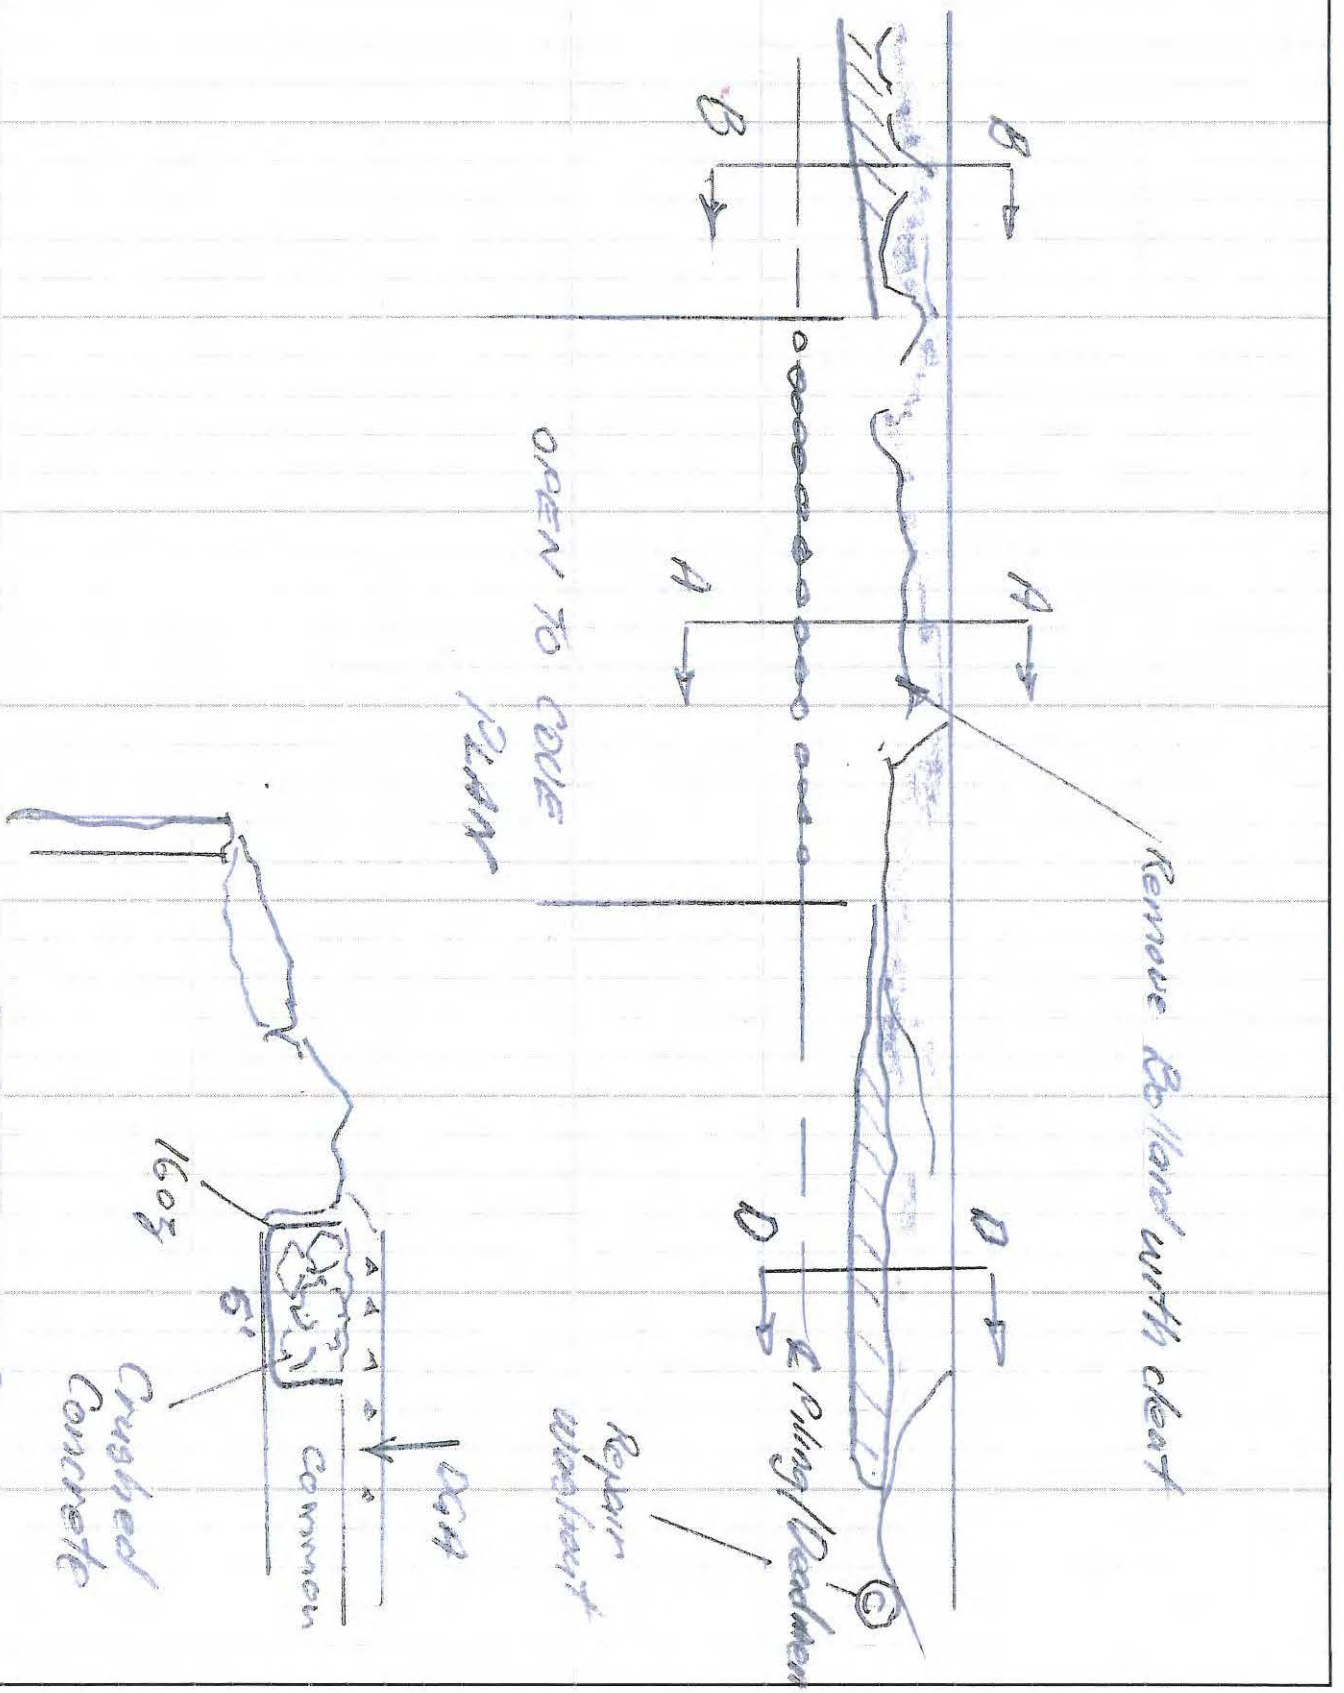
**Description of Change/Modification:**

The Southern limits of the Site 163 Chromium remediation extend close to the existing bulkhead. The bulkhead is in a dilapidated condition and has deteriorated subsequent to design of the remedy. During implementation of the remedy the condition of the bulkhead was visually assessed. As a result of this assessment it was determined that it was necessary to add additional protection to the backfill placed in Site 163 pending installation of the permanent replacement bulkhead. It was necessary to implement the restoration of the site rapidly after excavation to avoid the potential for inundation under high tides.

The design was modified in the field to include placement of geotextile fabrics and a sloped rip-rap facing to provide additional protection to the backfill.

The bulkhead condition is considered to be dynamic. It is recommended that this section of the bulkhead continue to be monitored pending replacement of the bulkhead.

Field Sketches were prepared to convey the general concepts and the final detailing was field engineered. Photos of the finished stabilized outer face are attached.



| | |

**FINAL DCB 017 – SA-6 NORTH AREA 1N HISTORIC FILL**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 017 Minor (a)<br>Effective Date: |
| Project Location: SA-6 NORTH, SA6-SOUTH | Associated RFI: |
| Title: SA-6N Area 1N 2 ft. Cut Historic Fill | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

The SA-6 North Remedial Action Work Plan, SA-6 100% Remedial Design Report, and the SA-6 North Consent Decree provides for the removal of the upper 2 ft., of historic fill from the SA-6 North Open Space Area. It is recognized that the original surface grade fluctuated significantly on SA-6N. For practical excavation control a more uniform excavation surface has been developed. That surface is based on a 2 ft. nominal cut +/- 1 ft. The areas selected for cut will be areas previously identified as historic fill with hexavalent chromium concentration of <20 mg/kg.

To increase capacity for movement of 20-240 mg/kg chromium impacted soils from SA-6 South to SA-6 North approximately 10,000 CY of historic fill will be excavated from SA-6 North. The final quantity may be adjusted based on survey quantities of impacted soils compacted and stockpiled in SA-6 South.

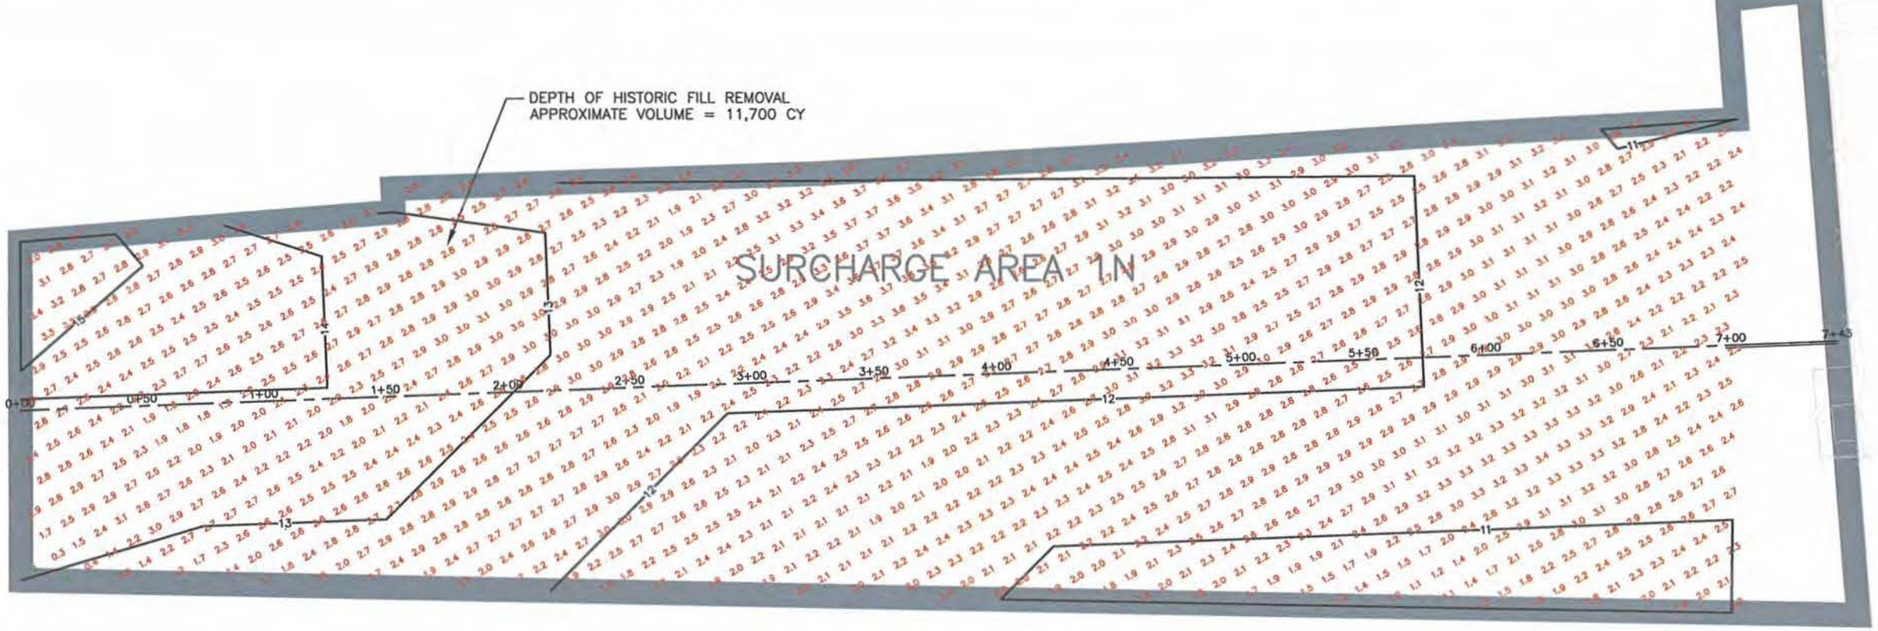
The excavation will be conducted to the lines and grades shown on Drawing CN XXX attached.

The bottom of excavation will be surveyed by a registered land surveyor.

Contractor shall stockpile the excavated material in designated location(s) mutually agreeable to Honeywell and Amec Foster Wheeler. The excavated materials will be sampled by Amec Foster Wheeler to determine the final disposition according to Section 2.2.4 of the Soil Management Plan (copy of section attached), as summarized as follows:

- Excavated materials that are confirmed <20 mg/kg for hexavalent chromium will be designated for reuse as backfill in excavations with the SA-6 North or SA-6 South Development Areas in accordance with the placement and compaction requirements of the Earthwork specifications (Section 02315) or may be placed above the cap but below the two feet of clean fill required by paragraph 56(c) of the SA-6 North Consent Decree.
- Excavated materials that are confirmed >20 mg/kg for hexavalent chromium will be designated for placement within the SA-6 North or SA-6 South Open Space Areas to be later covered with the cap.

The contractor will be notified by Amec Foster Wheeler as to the final disposition of the stockpiled excavated material.



| Reason for Change/Modification: | Explanation or Reason: Increase impacted soil capacity under the SA-6N Open Space cap. |

(a) – Major/Minor DCB designation – major DCB's impact cost and/or schedule and may require third party review/approval
(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

NOTES:

1. CONTOURS SHOWN HEREON REPRESENT THE PROPOSED BOTTOM OF EXCAVATION TO REMOVE APPROXIMATELY 2 FEET OF HISTORIC FILL FROM SURCHARGE AREA 1N.
2. EXCAVATION OF HISTORICAL FILL WILL BEGIN UPON APPROVED REMOVAL OF ALL SURCHARGE MATERIAL AND COMPLETION OF A PRE-EXCAVATION SURVEY BY A REGISTERED LAND SURVEYOR.
3. BOTTOM OF EXCAVATION CONTOURS MAY BE ADJUSTED BASED ON PRE-EXCAVATION SURVEY AND VERIFICATION OF ACTUAL SURCHARGE SETTLEMENT.
4. EXCAVATED HISTORIC FILL MATERIAL WILL BE STOCKPILED IN AN AREA DESIGNATED BY AMEC PERSONNEL FOR UTILIZATION DURING FUTURE DEVEOPMENT OR SAMPLED IN ACCORDANCE WITH THE SOIL MANAGEMENT PLAN TO DETERMINE FINAL DISPOSITION.

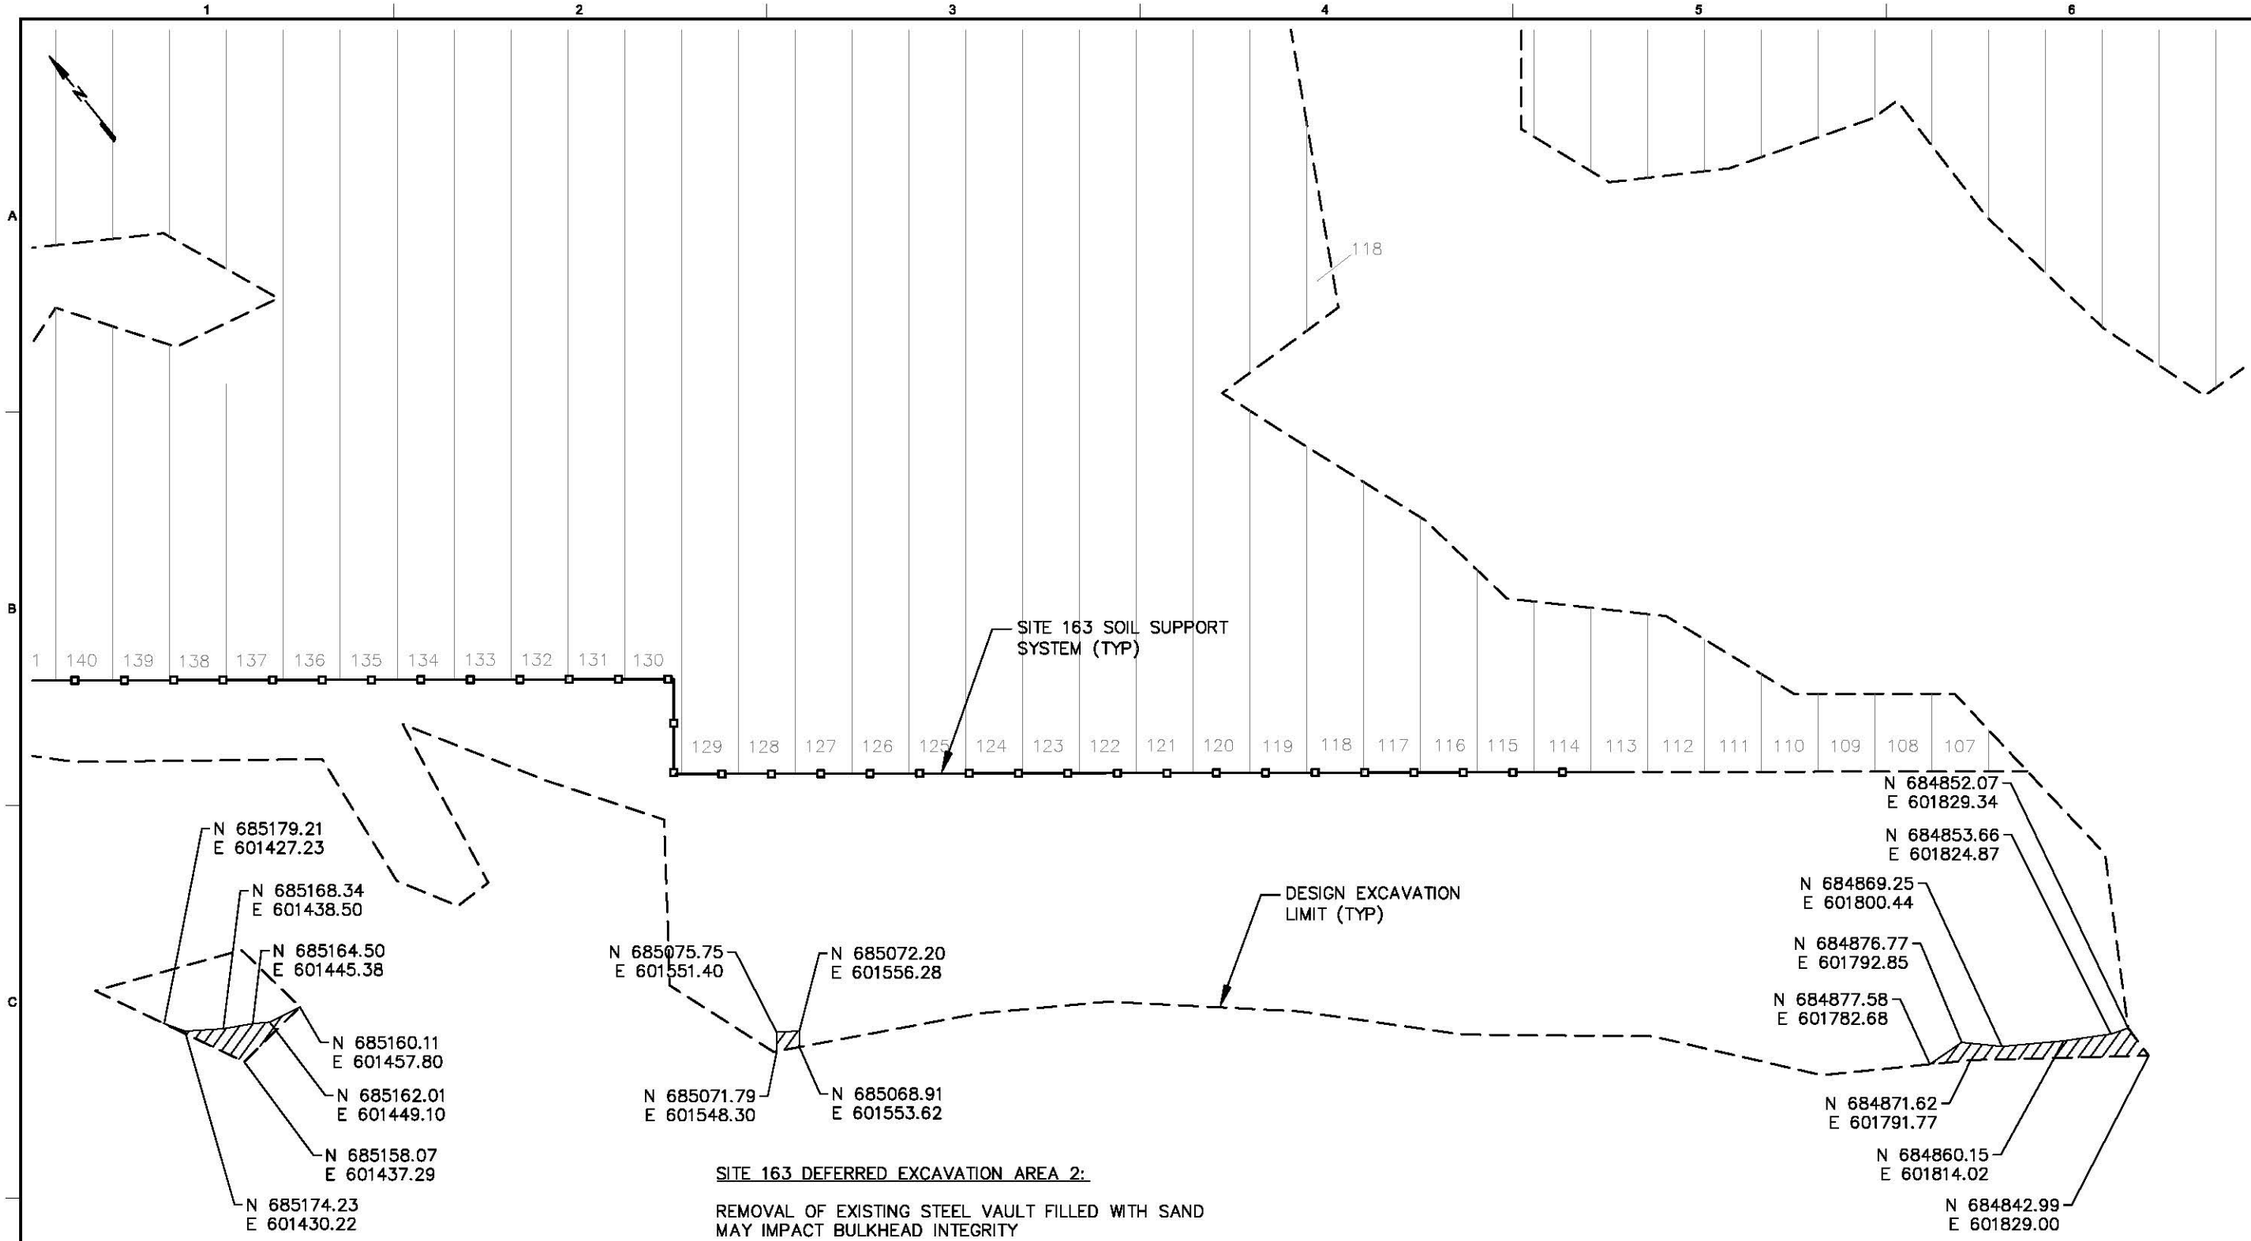
DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB Type: Minor (a)<br>Effective Date: 12/23/2014 |
| Project Location: SA-6 NORTH, SA6-SOUTH | Associated RFI: |
| Title: Site 163 Deferred Areas | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

When conducting the Site 163 shallow excavation remedy along the cove, unreinforced mass concrete and a steel structure were identified in direct contact with structural components of the bulkhead. These locations were inspected by the Amec engineer and it was determined that removal could be detrimental to the integrity of the bulkhead.

The location and description of the three isolated and small Deferred Areas are shown on the attached drawing.



The total volume of the materials left in place is estimated to be less than 35 cubic yards.

As noted the material left in place was concrete. There was no visible sign of the concrete being "chromium impacted".

The remediation of this de minimis material will be completed along with the other SA-6 South bulkhead deferral area along the river, once the permanent bulkhead is installed.

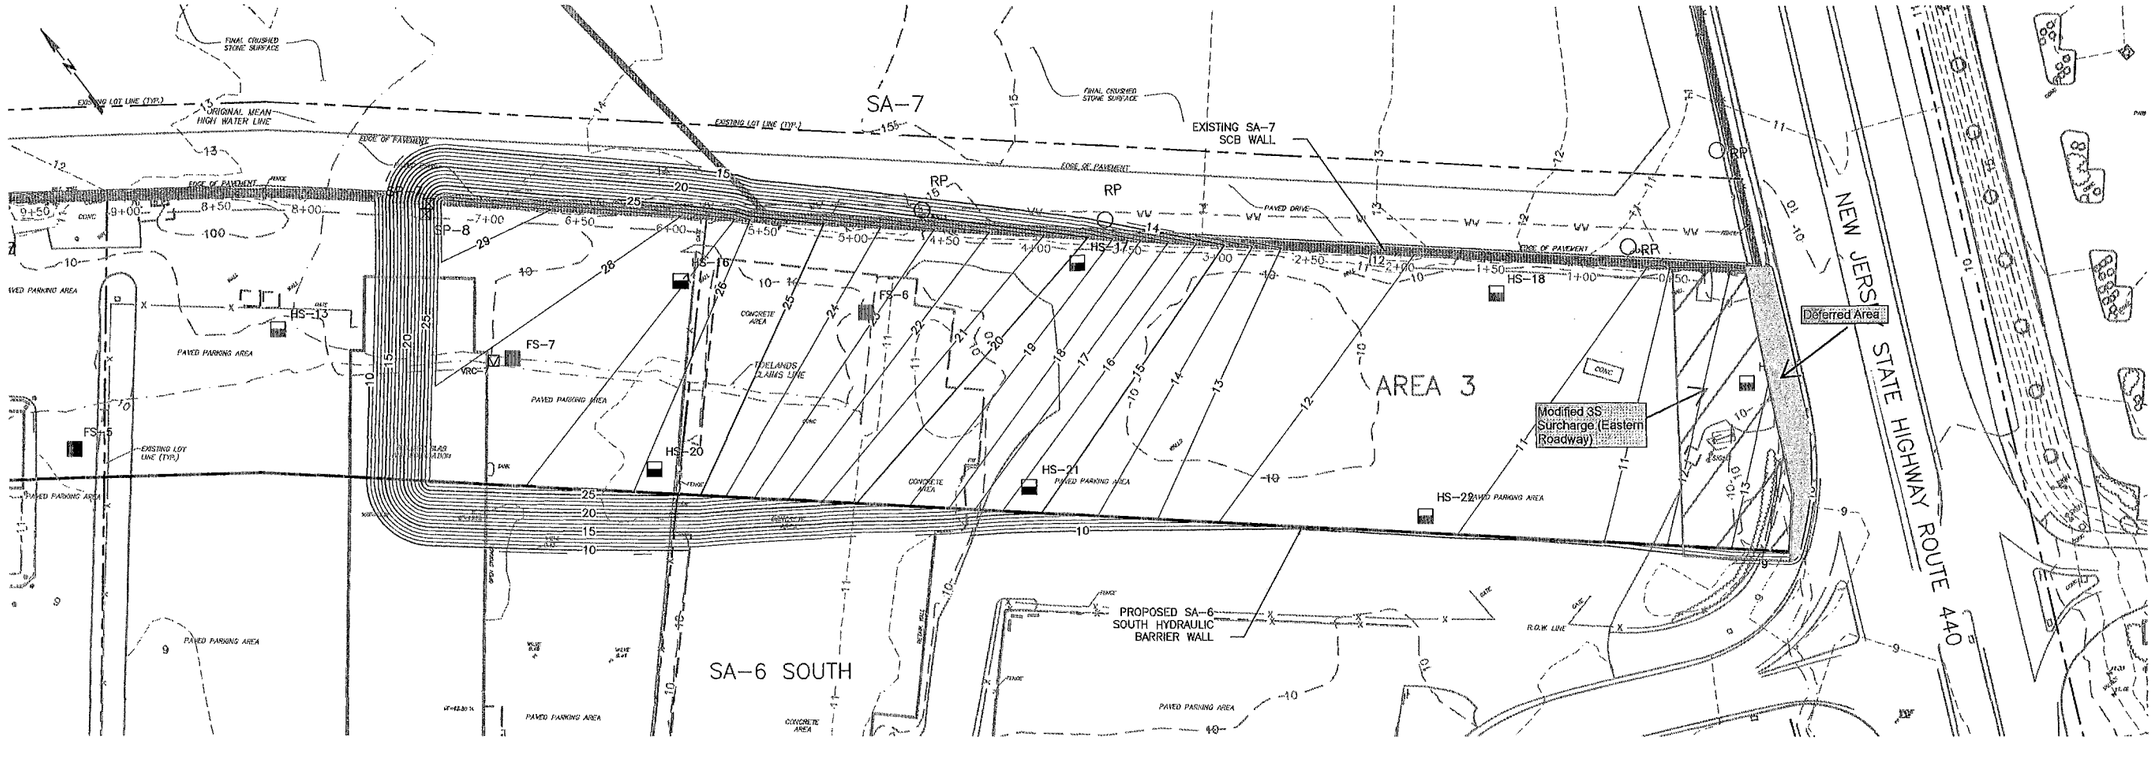
**FINAL DCB 021 – SURCHARGE IN AREA**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| Project Name: Chromium Remedy Study Area 6<br>Jersey City, NJ | DCB No.: 021 Minor (a)<br>Effective Date: 3/4/15 |
| Project Location: SA-6 SOUTH | Associated RFI: |
| Title: 3S Surcharge Pile Geometry on East End | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

Description of Change/Modification:



Reason for deferral:

The surcharge pile has been constructed to the design height of the barrier wall. The strip or land between the barrier wall and the property line is one of the "deferred areas" and varies in width from 0 to 12 feet. See attached figure. Final Development grades east of the barrier wall are at essentially the same grade as the existing grade. As such there is no additional load generated by the development grades and therefore there is no necessity of surcharge.

| | |
|---|---|
| Reason for Change/Modification:<br>☐ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other (describe) | Explanation or Reason.<br>Avoids placement of fill outside of the protective limits of the Barrier Wall. |

| Title: Contingent GW System Delete Pumps & Controls | ☐ Yes, RFI No. ___ ☑ None |
| | Project No.: 3480130377 |
| Contractor (Subcontractor): Entact | |

DCB 026.1 serves to provide notice to Entact that specific components related to the Contingent GW system are being removed from the scope. Associated drawing revisions and supplemental detail will be provided in DCB 026.2.

Supply and installation of items listed below will be deferred pending closure of the caps and stabilization of the groundwater levels and quality within the contingent groundwater system on both SA-6N and 6S. These changes impact the three Groundwater extraction Pump Stations and associated electrical and instrumentation wiring.

Revised Contingent Groundwater drawings will be issued under DCB 026.2

- DWG C-310 Detail CC
  - Submersible Grinder Pump Model HPGR200 and associated electrical wiring.
  - Level switches, level alarm, Pump Power Control Panel and associated electrical and instrumentation cable.
  - 1.5 inch flex discharge hose.
- DWG C-204. Flow Meter and Flow Meter Structure as detailed on DWG 306. Delete in its entirety including all associated instrument cable and conduit.

Contingent GW force mains, electrical and instrument conduit will be installed as shown with pull string/wire to permit installation of electrical and instrumentation wire by others.

Please Note that the above Geomembrane pump station including all pumps, wiring and controls will be installed as shown.

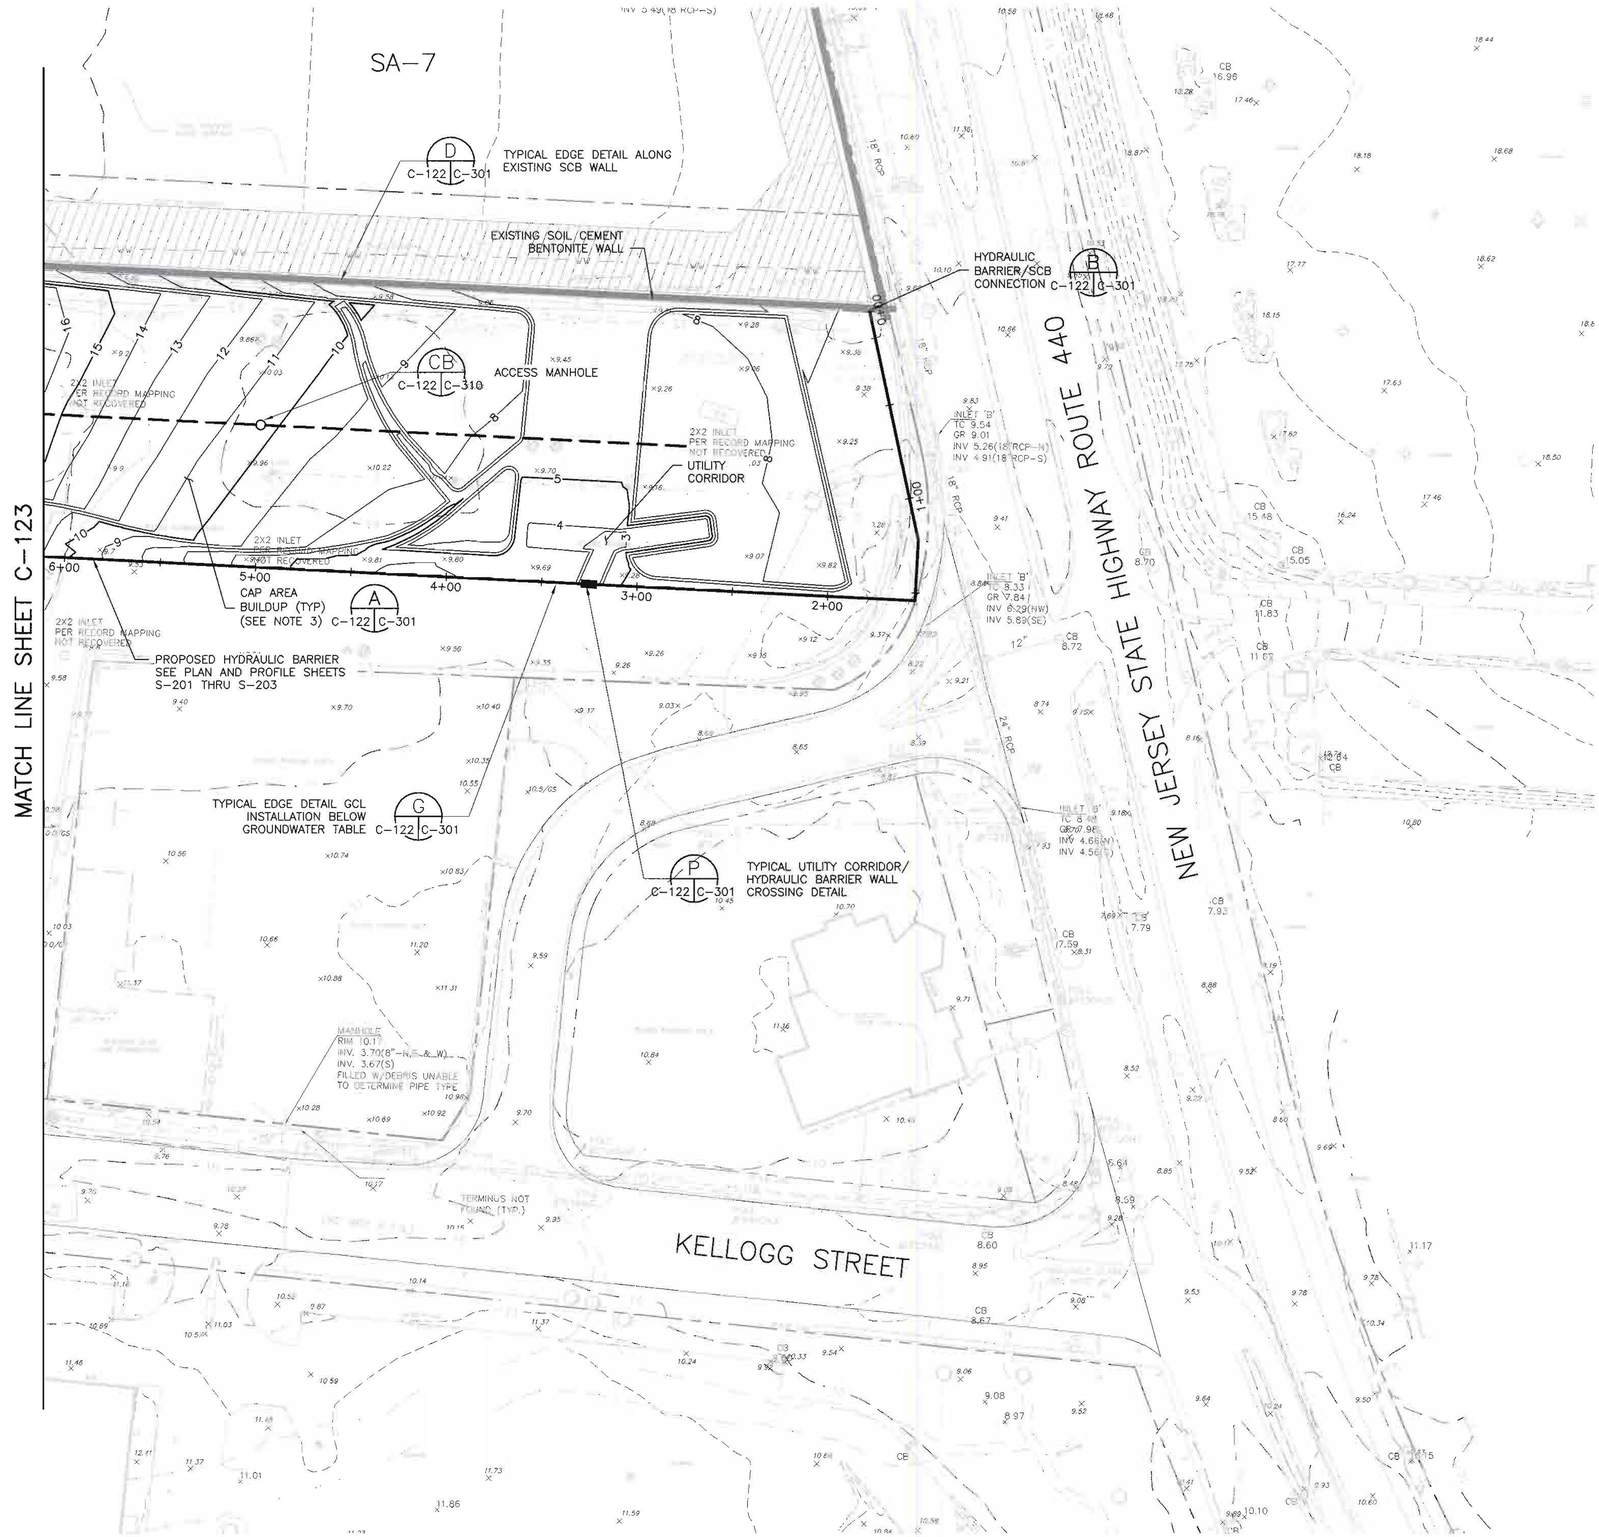
**FINAL DCB 027 – ELIMINATE UTILITY CORRIDOR**

Honeywell RES

Honeywell.com



DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 27 **DCB Type:** Major (a)<br>**Effective Date:** 6/15/15 |
| **Project Location:** SA-6 South | **Associated RFI:** |
| **Title:** Eliminate Utility Corridor by Route 440 | ☐ Yes, RFI Nos. ☑ None |
| | **Project No.:** 3480130377 |
| **Contractor (Subcontractor):** ENTACT | |

Bayfront Redevelopment Civil Designer has eliminated one utility corridor along the eastern portion of SA-6 South (water main and sewer line were relocated to another utility corridor). This DCB provides the associated adjustment in the Geomembrane Subgrade design. In addition, it was identified that minor changes in the Bayfront final grades of up to 0.25 ft may be made in the landscaped areas (no changes were made to the roadway grades). The difference between the adjusted Geomembrane Subgrade surface and Final Grade surface has been verified to meet the minimum and average requirements of the SA-6 South Consent Decree and the 100% Design.

| | |
|---|---|
| **Reason for Change/Modification:**<br>☐ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other | **Explanation or Reason:** See additional comments<br>**Attachments:** ☑ Yes ☐ No<br>Drawing C-122<br>Cost Implication: ☐ Yes ☑ No<br>>$50k ☐ Yes ☑ No<br>Schedule Implication ☐ Yes ☑ No |
| **Additional Comments:** CHA revisions to the Development utilities resulted in the relocation of a firewater and sanitary sewer line near Route 440. The relocation eliminated the necessity for a utility corridor. Eliminating the corridor from the subgrade simplifies the geomembrane installation, eliminates two penetrations of the SA-7 SCB Wall, and reduces the extent of submerged barrier wall to geomembrane connection.<br>Final and Subgrade surfaces have been prepared for use with the Machine Control. A Construction Control Grid has also been established for the purpose of documenting compliance with the 100% Design. | **Design Documents Affected:**<br>Drawing C-122 |

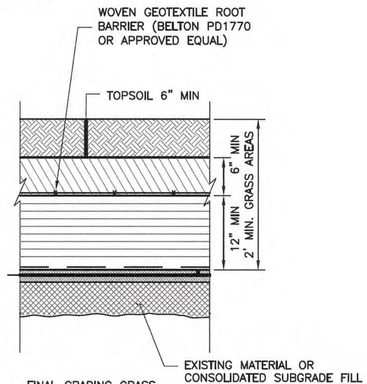
## CONSENT DECREE NOTES:



THE CAP SHALL BE INSTALLED IN ACCORDANCE WITH THE REQUIREMENTS OF THE UNITED STATES DISTRICT COURT, DISTRICT OF NEW JERSEY, CONSENT DECREE REGARDING REMEDIATION AND REDEVELOPMENT OF STUDY AREA 6 NORTH AS FOLLOWS:

- ARTICLE III CHROMIUM REMEDIATION, SECTION A CHROMIUM REMEDY, SUBSECTION 56(a): EXCLUSIVE OF ROADWAYS, THE CAP SHALL BE OVERLAIN BY LAYERS OF CLEAN FILL, BACKFILL AND/OR OVERBURDEN WITH AN AVERAGE DEPTH OF AT LEAST THREE FEET AND A MINIMUM DEPTH OF AT LEAST TWO FEET PROVIDED THAT ANY LAYER THAT INCORPORATES OVERBURDEN SHALL BE BELOW AT LEAST TWO FEET OF CLEAN FILL. ONE FOOT OF CLEAN FILL, COVERED WITH BITUMINOUS BLACKTOP, SHALL BE SUFFICIENT COVER WHERE ROADS, WALKWAYS, OR OTHER PAVED SURFACES ARE LOCATED WITHIN THE AOC 1 OPEN SPACE AREA.
- ARTICLE III CHROMIUM REMEDIATION, SECTION B LONG-TERM MONITORING, MAINTENANCE, AND PROTECTION OF ENGINEERING AND INSTITUTIONAL CONTROLS, SUBSECTION 60(j)(v)(6): IF THE LOWEST ELEVATION FOR THE BEDDING FOR ANY UTILITY LINE, INCLUDING IRRIGATION OR SPRINKLER LINES, IS TWO FEET FROM THE TOP OF THE WARNING LAYER OF THE CAP, THE UTILITY LINE SHALL BE PLACED IN A UTILITY CORRIDOR.
- ARTICLE III SUBSECTION 56(a) "AND A DISTINCTIVE COLORED WARNING LAYER WITH MARKINGS IN ENGLISH AND SPANISH THAT WOULD DETER PENETRATION OF THE CAP IN THE EVENT THAT DIGGING OCCURRED IN THE VICINITY OF THE CAP.

**FINAL DCB 029 – PIEZOMETER LOCATIONS**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name: Chromium Remedy Study Area 6 Jersey City, NJ** | **DCB No.: 29 DCB Type: Minor (a)** |
| | **Effective Date: 6/5/15** |
| **Project Location: SA-6 South** | **Associated RFI:** |
| **Title: SA-6 South Contingent GW Piezometer Locations** | ☐ Yes, RFI No. __ ☑ None (Request via e-mail) |
| | **Project No.:** 3480130377 |
| **Contractor (Subcontractor): ENTACT** | |

**Description of Change/Modification:**

The general location of the paired piezometers was depicted in the Plan view of the Contingent system.

Specific coordinates were not included.

ENTACT has requested specific coordinates.

In preparing the coordinates Amec Foster Wheeler reviewed the locations shown in the IFC design with the latest road and utility designs prepared by CHA. This has resulted in minor movements of the piezometers. The movement will have no impact on the performance of the piezometers to meet their intended purpose for measurement of the hydraulic gradient across the barrier wall.

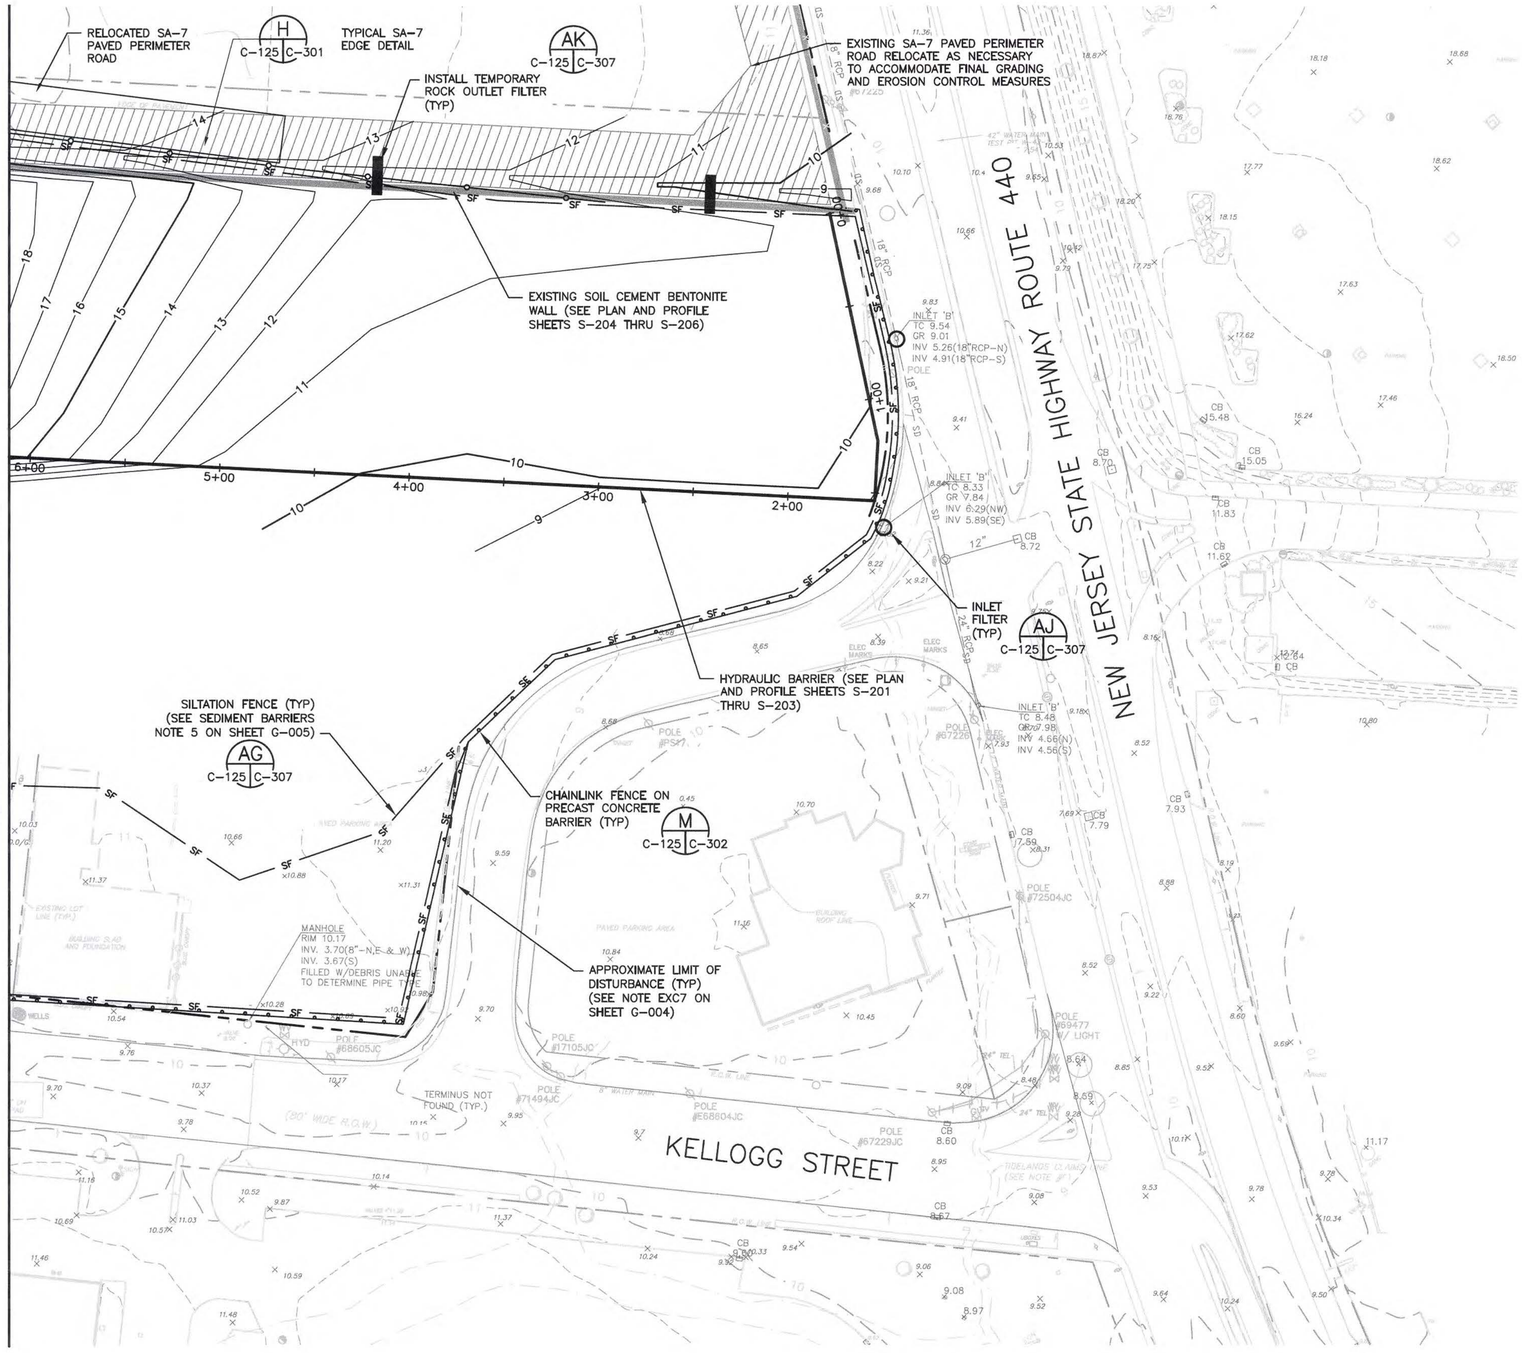
**FINAL DCB 030 – SA-6 SOUTH FINAL GRADING**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.: DCB 030 Type:** Minor(a)<br>**Effective Date: 11/12/2015** |
| **Project Location:** SA-6<br>**Title:** Final Grade Revisions | **Associated RFI:**<br>☑ Yes, RFI Nos. 057 ☐ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |



**Description. The Final Grades were revised to allow for a 0.25 increase in subgrade elevations eastern portions of SA-6 where subgrade had not been completed at the time (July 2015). The changes in subgrade were made in conjunction with the elimination of the utility corridor near the jug handle. The Subgrade changes were conveyed in DCB 027.**

**In parallel with the grade changes Amec Foster Wheeler and Entact developed a methodology for adapting grading of the cover soils to offsets from either subgrade or Final Development Grade. The methodology was described in the response to RFI 057. Some minor changes (0.1 to 0.2 ft.) have also been made in localized areas to improve surface drainage.**

**Offsets from the final cover soil will be used in the Machine Control to complete cover soil grading as noted in RFI 057. This DCB impacts Final Grade Drawings C-125, C-126 and C-127 and the associated electronic files.**

| | |
|---|---|

**FINAL DCB 030.1 – SA-6 SOUTH FINAL GRADE**

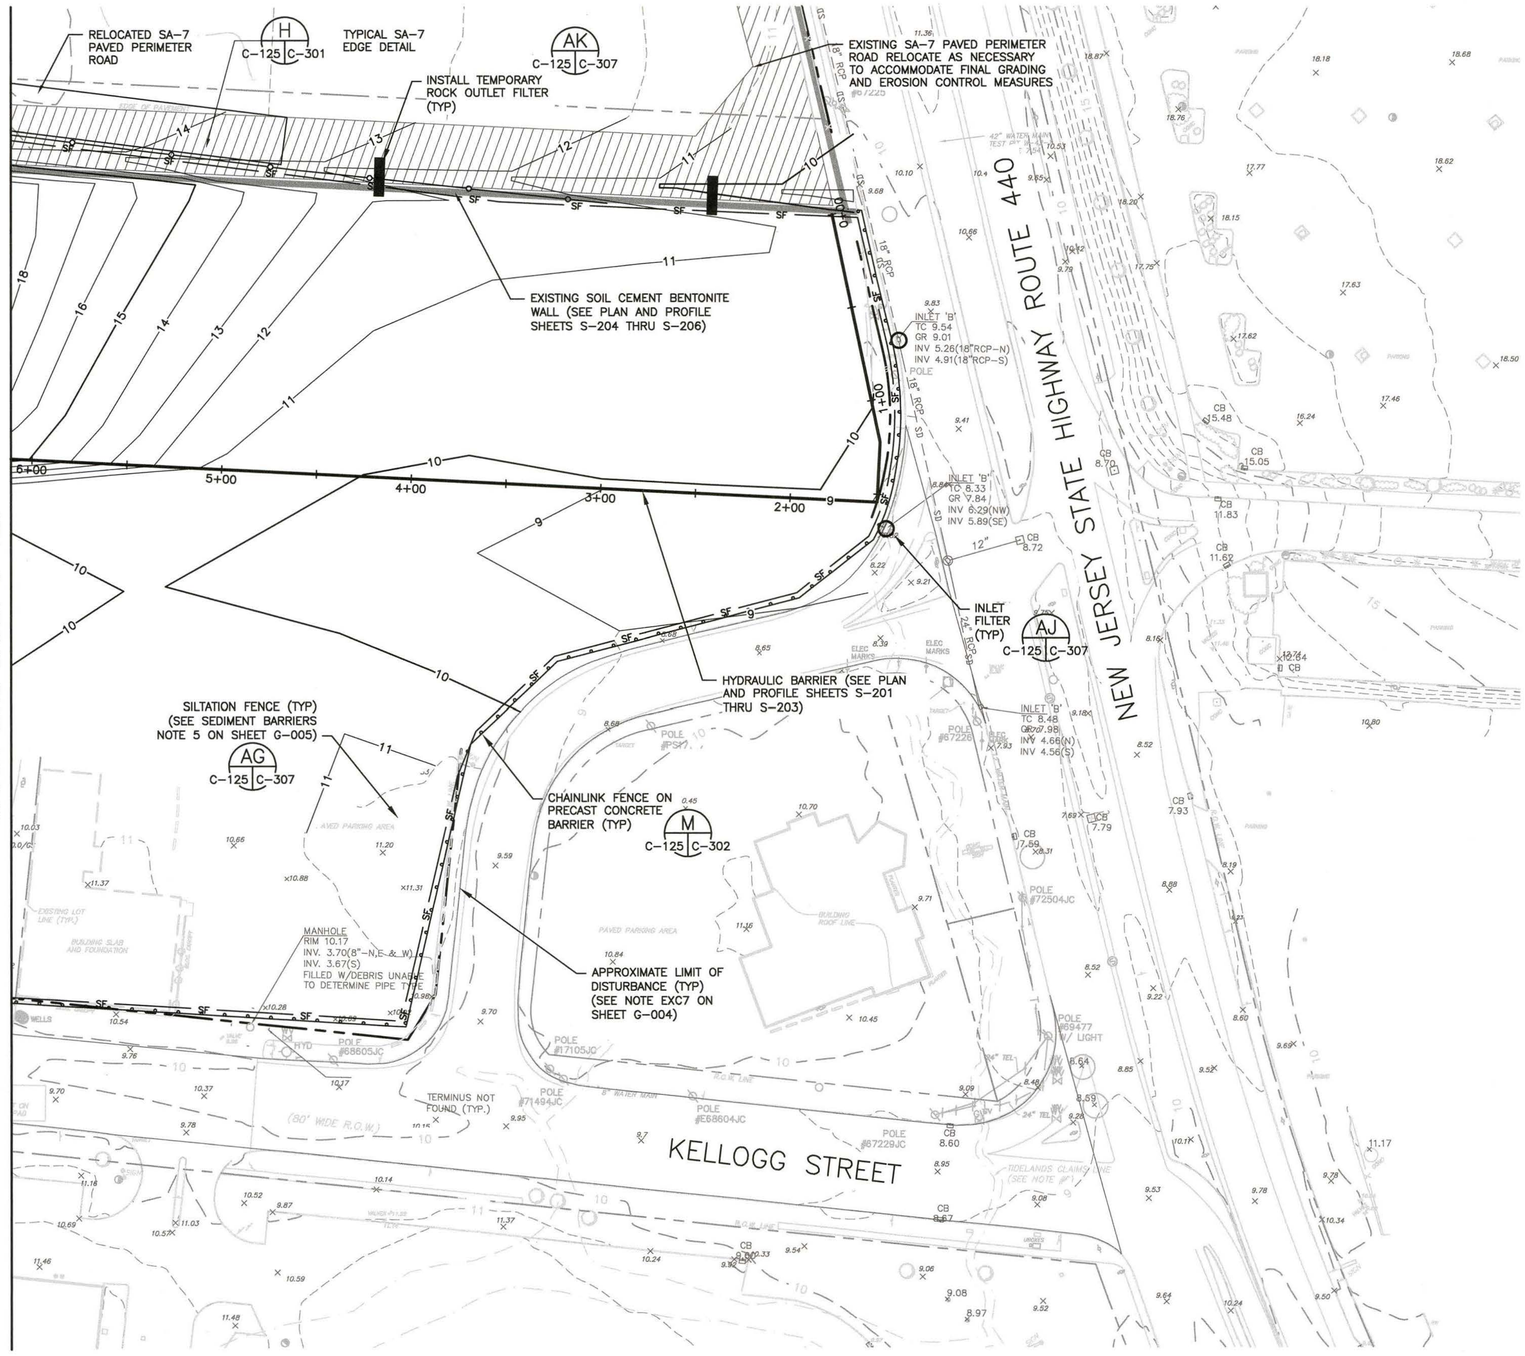
Honeywell RES

Honeywell.com

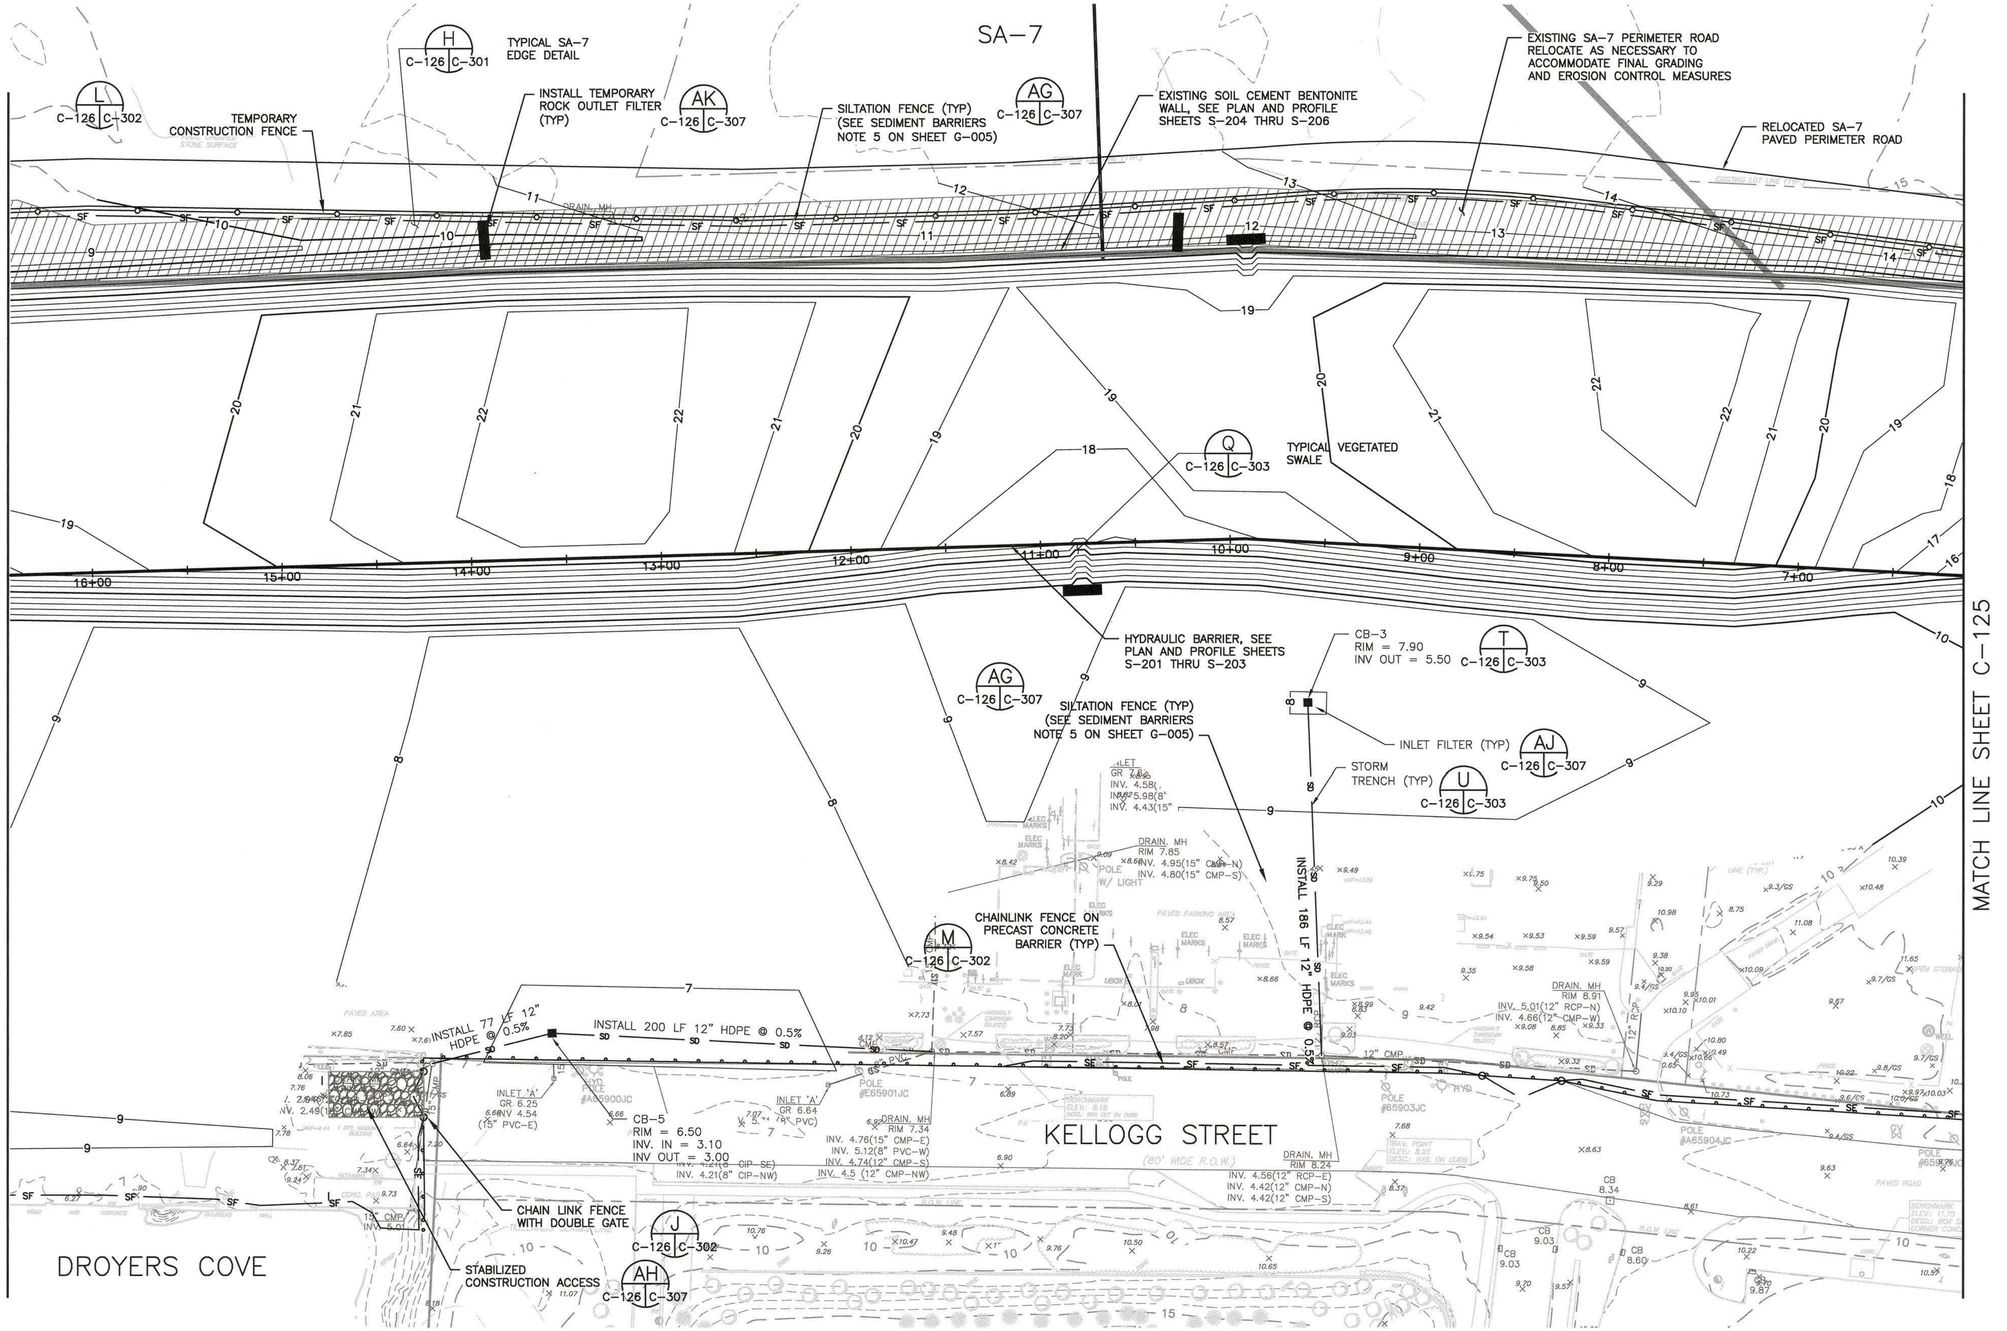
DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 030.1 **DCB Type:** Minor(a)<br>**Effective Date:** 4/15/16 |
| **Project Location:** SA-6 South<br>**Title:** Final Grade Revisions | **Associated RFI:**<br>☐ Yes: ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.** DCB 030 provided for revision to the Final Grades to allow for a 0.25 foot increase in subgrade elevations in the eastern portions of SA-6S Open Space AOC.



DCB 030.1 relates to the Final Grades in the "Development AOC" south of the Open Space AOC. Both the Open Space AOC and the Development AOC grading is shown on the Final Grade Drawings C-125, C-126 and C-127.



The associated electronic files for the grading will be transmitted as part of this DCB. The Development Plan grading is shown at 1 ft. contours. Due to the relatively "flat" final grades,p 1 ft. contours as shown in the hard copy do not provide details on break points. The electronic files provided as part of this DCB do provide detailed information on the grading. Therefore the electronic files will be used for grading.

The Final Cover Soil types are shown on the Restoration Plan C-128. Sheet C 309 Civil Details has been updated to reflect the use of Skaps 121 as the demarcation layer.

**FINAL DCB 030.2 – SA-6 SOUTH FINAL GRADING AND RESTORATION**

Honeywell RES

Honeywell.com

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 030.2 **Type:** Minor(a)<br>**Effective Date:** September 2016 |
| **Project Location:** SA-6 South | **Associated RFI:** |
| **Title:** Cap Final Grading and Development Area grading and Restoration | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.** This DCB summarizes several field engineering directions provided to Entact. This DCB includes several minor revisions to the final grading in the SA-6 South Chromium Remedy Cap and Development Areas. The changes have been made to improve surface water flows and enhance Sedimentation and Erosion Control Drawings C-125, C-126 and C-127 cover the area of both the Cap and the Development Area. The Restoration details previously shown on drawing C-128 have been added to these three drawings. C-128 has been deleted from the set.

- Installation of a crushed stone toe drain along SA-7 toe, and use of the former asphalt roadway to conduct stormwater to the Hackensack River, in lieu of the "in-slope" parabolic swale shown in the IFC design. The drain is located where the toe of slope temporarily terminates in SA-7 pending raising SA-7 to the Bayfront Development grades. The toe drain is considered to be more resilient than the original swale design and will provide equal or better sedimentation and erosion control.
- Adding topsoil over the eastern 300 ft. of the cap along SA-7/SA-6S boundary to provide for a gradual transition from the SA-7 paved road to the SA-6S Final Grades.
- Extent of demarcation geotextile, crushed stone, and DGA placed over the Development Area to meet covering of Historic Fill regulations. The restoration grades were modified to accommodate placement of gravel over foundations and pavement in a number of areas that were not included in the IFC restoration drawing.
- Installation of Erosion Control mat on the steep edge slopes on the north and south sides of SA-6S. The precise limits of mat will be determined in the field based on observed performance.
- Installation of supplement diversion berms to direct water through the culverts under the temporary roads. The location and size of the berms shown on the drawings may be modified in the field based on observation of the performance in storm events
- Installation/restoration of stone check dams and diversion dams near the surface water outfall to the Hackensack River on SA-7. The precise location and dimension of the check dams will be field engineered based on observed flow during storm events.

**FINAL DCB 032 – SA-6 SOUTH IN-SITU**

# DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB Type:** Major (a)<br>**Effective Date:** 6/18/15 |
| **Project Location:** SA-6 South | **Associated RFI:** |
| **Title:** SA-6 South, Site 163 In-situ Injections | ☐ Yes, RFI No. ___ ☑ None |
| | **Project No.:** 3480150438.5710.571001 |
| **Contractor (Subcontractor):** ERFS | |

Amec Foster Wheeler and ERFS performed in-situ injections of calcium polysulfide (CAPS) at SA-6 South, Site 163 in July & August 2014. 6-month performance assessment soil samples were collected and analytical results indicated that seven of the fifteen treatment areas at the Site are now <20 milligrams per kilogram (m/kg) for Cr(VI). Honeywell will implement additional CAPS injections at several of the areas that remain >20 m/kg for Cr(VI). See attached memorandum, figures, and Table 1 prepared by Amec Foster Wheeler. While the specific scope of this next field phase is provided in the attachment, the work will generally be performed in accordance with Amec Foster Wheeler's approved *Work Plan for In-Situ Treatment of Chromium Impacted Soil*, dated September 2012.

| | |
|---|---|
| **Reason for Change/Modification:**<br>☑ Unforeseen or Differing Site Conditions<br>☑ Design Revision<br>☐ Owner/Client Request<br>☐ Other | **Explanation or Reason:** Initial injections did not fully reduce soil sample concentrations of Cr(VI) to 20 m/kg. |
| | **Attachments:** ☑ Yes ☐ No |
| | Cost Implication: ☑ Yes ☐ No<br>>$50k ☑ Yes ☐ No<br>Schedule Implication ☐ Yes ☑ No |
| **Additional Comments:** | **Design Documents Affected:** *Work Plan for In-Situ Treatment of Chromium Impacted Soil* (Amec Work Plan), dated September 2012 |

(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

# Memo

**Date:** June 18, 2015

**From:** Joe Clifford/Dennis Nagg/Ted Toskos – Amec Foster Wheeler

**To:** Bill Hague – Honeywell

**cc:** John Morris, Maria Kaouris, John Mojka – Honeywell
Jeremy Karpatkin, Michael Daneker – Arnold & Porter

**Subject:** Summary of Proposed Additional In-Situ Treatment Program for Hexavalent Chromium Impacted Soils, SA-6 South, Site 163

Amec Foster Wheeler E & I (Amec Foster Wheeler), on behalf of Honeywell, has prepared this memorandum to summarize the proposed additional injections of calcium polysulfide (CAPS) for in-situ treatment of hexavalent chromium (Cr(VI)) impacted soils at SA-6 South at Site 163, the former Posnak and Turkish location (the Site). Analytical results from the 6-month performance assessment soil sampling were summarized in a submittal to All Parties, dated June 10, 2015 and indicated that seven of the fifteen treatment areas at the Site are now <20 milligrams per kilogram (m/kg) for Cr(VI).

As indicated at the Special Master All-Hands meeting on May 19, 2015 and in the 6-month performance assessment soil sampling summary memo, Honeywell will implement additional CAPS injections at seven of the eight areas that remain >20 m/kg for Cr(VI). Although the Amec Work Plan specified that results of soil sampling conducted 3 years after the completion of injections would determine treatment efficacy, due to the planned start of the Bayfront Redevelopment project expected by the second quarter 2016, Honeywell has decided to implement the additional injections at this time to increase the probability of program success prior to the 3 year sampling event.

These seven areas which will have this additional treatment include Areas H, I, J, K, L, M, and N. **Figure 2D** through **Figure 2F** (revised from the September 5, 2014 summary of the completed CAPS injection program) are included and show proposed injection point (IP) and temporary well point (TWP) locations for the seven areas. Due to the proximity of Area F to the bulkhead along Droyers Cove and the potential for unpredictable subsurface preferential pathways in that area, additional injections will not be implemented in this area. Instead, Honeywell will defer

200 American Metro Blvd
Suite 113
Hamilton, NJ 08619
609-689-2829
amecfw.com

addressing this area until the bulkhead improvements are implemented as part of the Bayfront Redevelopment project.

### Scope of Proposed Additional In-Situ Injection Program

The attached **Table 1** indicates the injection volume estimates for the additional in-situ injection program for Areas H, I, J, K, L, M, & N. The calculation of injection volume estimates are generally similar to those for the original injection program with the following exceptions:

- The factor for the CAPS Stoichiometric Dosage Solution was increased from 2.5X to 5X; and
- The injection approach may be differentiated in treatment areas based on whether the areas lie north or south of the northern edge of the curbline of the new Kellogg Street proposed for the Bayfront Redevelopment.

The doubling of the CAPS Stoichiometric Dosage factor is recommended for these remaining areas for the following reasons:

- Initial treatment in these zones did not demonstrate the same efficacy as was observed in other Site 163 areas and SA-6 North Treatment areas 7 and 8
- The imminent timing pressures to complete implementation of remaining in-situ measures so as not to impact the Bayfront Redevelopment which is planned to start with the Kellogg Street properties.

As shown on **Figure 2D** through **Figure 2F,** the spacing between IPs may be reduced (increased number of IPSs) in treatment areas or portions of treatment areas that lie north of the new Kellogg Street curbline. This increased injection point density will potentially invoke a more robust dispersion of CAPS solution.

The proposed additional in-situ injection program for Areas H, I, J, K, L, M, & N as indicated on the attached **Figure 2D** through **Figure 2F** and **Table 1** is summarized as follows.

- Means and methods will generally follow the Amec Work Plan; ERFS' In-Situ Chemical Reduction Implementation Work Plan, dated September 2013; and ERFS Health and Safety Plan, dated June 2013 (Revised July 2014).
- Additional injections to occur in Areas H, I, J, K, L, M, & N from approximately 8 to 18 feet below grade.

- Injections in each area are to occur over a 6-foot vertical profile.
- A total of 4,100 gallons of 29% CAPS will be mixed with approximately 37,300 gallons of potable water to produce the CAPS solution.
- The 41,400 gallons of CAPS solution will be injected into approximately 86 injection locations.
- Areas surrounding injection locations will be monitored for evidence of daylighting.
- If daylighting occurs, the liquid will be contained at the daylighting site and be allowed to seep back into the ground.
- Injection activities will be adjusted as necessary to eliminate excessive daylighting.
- Thirty-four (34) 1-inch diameter PVC TWPs will be drilled and installed within and adjacent to the treatment areas.
- The following measurements will be taken and recorded in TWPs prior to the start of injections (baseline), during injections, and following completion of injections:
    - Depth to groundwater;
    - Groundwater quality parameters, including pH, oxidation/reduction potential (ORP), specific conductivity (SC), and total dissolved solids (TDS);
    - Hydrogen sulfide (H2S) and volatile organic compounds (VOCs) in the headspace of the PVC riser pipe; and
    - Groundwater color and/or odor.
- The breathing zones at storage, mixing, and injection areas will be monitored for hydrogen sulfide ($H_2S$).
- The breathing zones at drilling locations will be monitored for volatile organic compounds (VOCs) and $H_2S$.
- Honeywell will obtain a new Discharge to Groundwater – Permit By Rule from NJDEP for the injection activities.
- All as-built IP and TWP locations will be surveyed to determine their position.

### Interim Performance Assessment Soil Sampling and Reporting

Approximately six months after the completion of these additional injections in Areas H, I, J, K, L, M, and N (weather permitting), Honeywell will collect soil samples at generally the same

locations as those collected in April 2015 and generally using the same protocol. All of the 6-month performance assessment soil samples will be analyzed for the following:

- Total chromium;
- Hexavalent chromium;
- Sulfide;
- pH; and
- Oxidation Reduction Potential (ORP).

Upon receipt of final validated analytical results, the 6-month performance assessment soil sampling will be summarized in a memorandum and on tables and “chem-box” figures and will be transmitted to All Parties in a timely manner.

The Amec Work Plan also called for a performance assessment three years after completion of the injections. As has been previously discussed with the parties, Honeywell has advised it may seek to conduct the second performance assessment sooner than 3 years after completion of the Site 163 injection program, and in that case will provide a proposal to the parties for their review and comment.

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 34 **DCB Type:** Minor (a) |
| | **Effective Date:** 6/15/15 |
| **Project Location:** SA-6 | **Associated RFI:** |
| **Title:** Survey Clarification | ☐ Yes, RFI Nos. ☐ None |
| | **Project No.:** 3480130377 |
| **Contractor (Subcontractor):** ENTACT | |

Design Surface. The 100% Design CAD files defines the subgrade surface. The surface is developed in CAD as a Triangular Irregular Network (TIN). For construction control and verification of compliance with Cover thickness requirements in the Consent Decree and Open Space Design Standards the Construction Control Grid (as noted above) will be applied to the TIN.

Specification 01460 sets out the requirements for survey. In conducting a detailed review of the design of the subgrade, and methods of implementation including the use of GPS based machine control the following clarifications to the documentation requirements at defined in following sections.

- SECTION 1.04. C. The Contractor shall establish a grid system (Construction Control Grid) with a maximum spacing of 25 feet with additional grid points as required for grade breaks (toe, top of slopes) over the entire limits of Work. The grid system shall be established for the purpose of determining required excavation and fill thickness.

- SECTION 1.04 E. Vertical and horizontal control shall be sufficient to assure work is constructed within 0.1 foot of proposed fill thickness requirements (or proposed grades as indicated) and location.

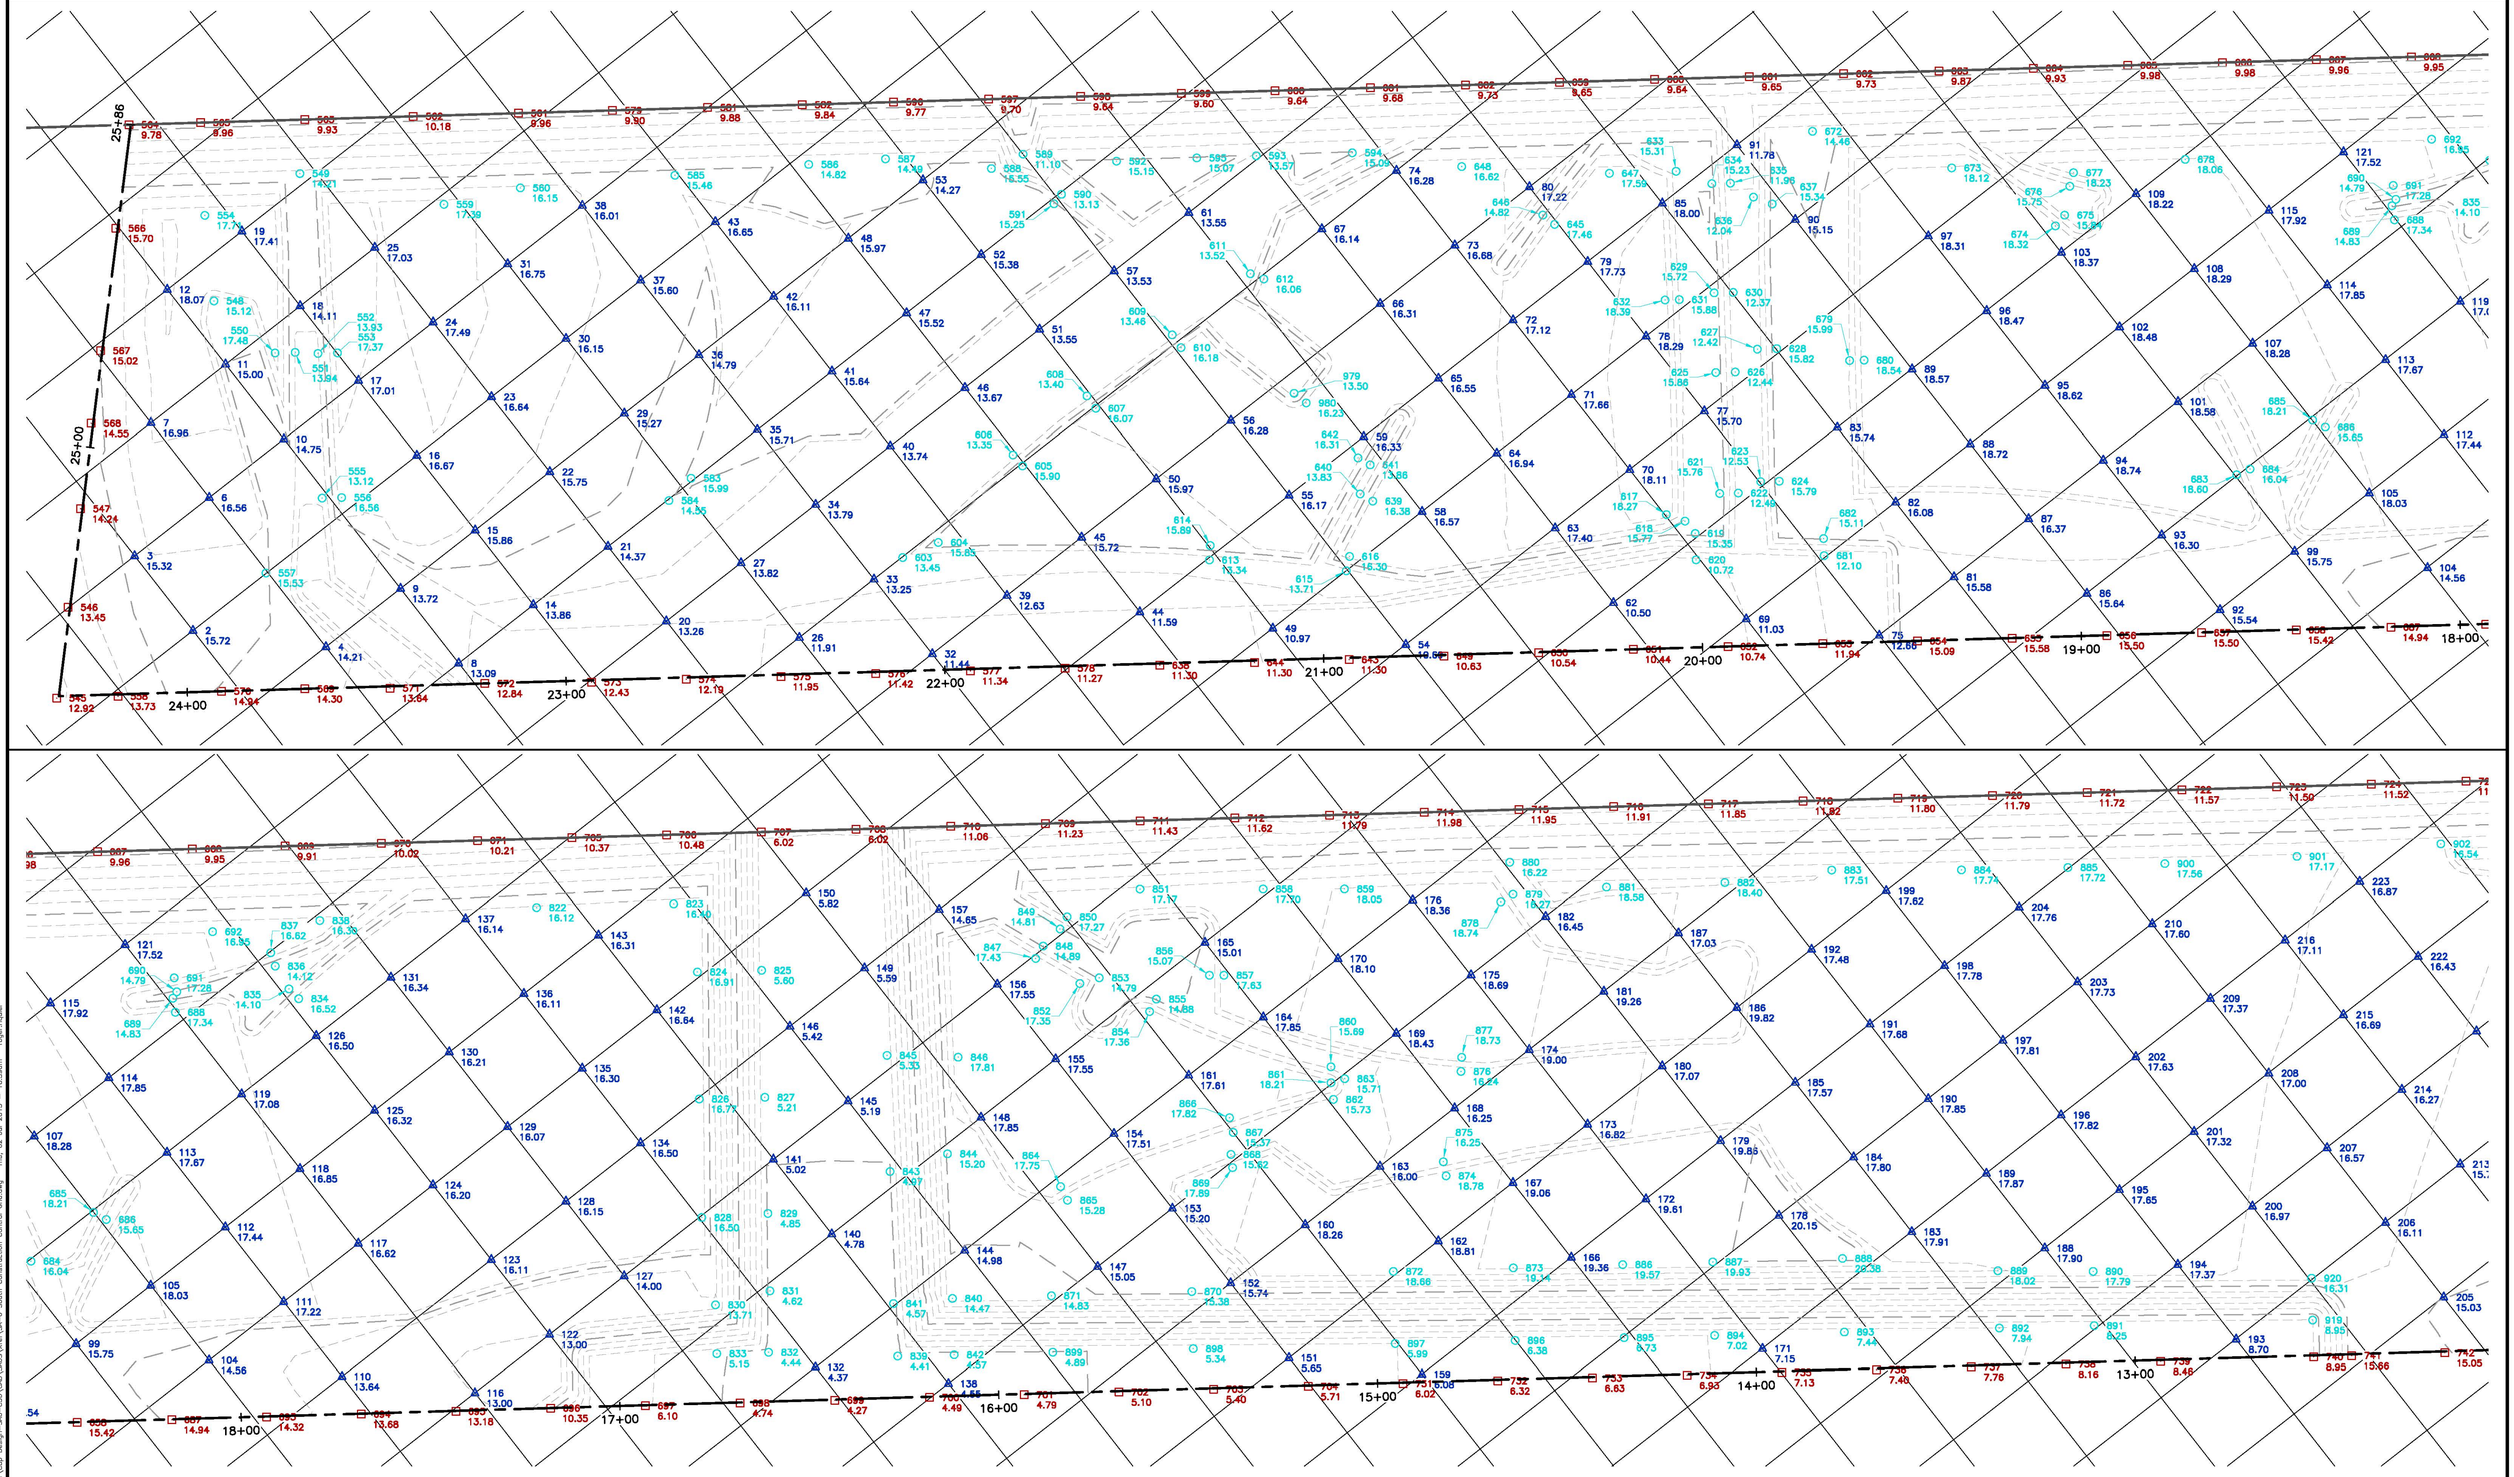
- SECTION 1.05 F. Spot Elevations - Survey shall be constructed to provide an accuracy of 0.1 feet vertically. Ninety percent of all spot elevations placed on the maps shall have an accuracy of at least 0.1', and the remaining 10 percent shall not be in error by more than one-half (1/2) the contour interval (0.5').

- The slopes shall be visually inspected to verify that they are uniform (straight line) for top of slope to bottom of slope.

- The net result of these clarifications is an increase in the number of points on the Construction Control Grid.

The elevation at each 25 ft. grid node will be documented as the "Design Elevation". Where nodes fell on steep slopes the single node will be deleted and replaced with two points at the top of slope and bottom of slope. Points will also added to the Construction Control Grid along the boundaries of the cap and isolated supplemental points added at specific locations to provide supplemental information. Points falling in the 25 ft grid will be subject to the tolerances specified in SECTION 1.04 E. Break points added to replace Grid Points that fell on slopes and Boundary Points will be treated as Spot Elevations as defined in SECTION 1.05 F.

The Contractor (QC), Engineer (QA) and Surveyor (licensed surveyor) will all record elevations at the same locations.



Contractor Layout. The contractor will add points based on the TIN and utilize the contour plots produced from the TIN to aid in layout of the work as necessary.

Registered Survey Documentation. The registered surveyor will survey and record the elevations on the Construction Control Grid. This information will be used to certify that the subgrade has been built to the design elevations.

The Contractor (QC), Engineer (QA) and Surveyor (licensed surveyor) will all record elevations at the same locations.

# FINAL DCB 035 – GAS VENT SYSTEM

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 35 **DCB Type:** Minor (a)<br>**Effective Date:** 7/16/15 |
| **Project Location:** SA-6 | **Associated RFI:** |
| **Title:** Revised Gas Vent System Alignment | ☑ Yes, RFI Nos. 50 & 51 ☐ None |
| | **Project No.:** 3480130377 |
| **Contractor (Subcontractor):** ENTACT | |

**Description**

The alignment of the gas vent system piping and trench was modified in the west portion of the SA-6 South cap to establish smooth grades in the utility corridors and avoid contingent groundwater extraction system components.

| | |

Typical Section Utility Corridor

SECTION XX is typical detail as shown on GAS VENT DETAIL AN C-121

Wrap Gas Vent Pipe with min 1 layer of GDL or Class A Geotextile. Overlap wrap min 1/4 of pipe circumference

SEQUENCE,

1. Excavate trench on slope. Extra 6" on typical detail is not required but can be used
2. Wrap HDPE as noted
3. Backfill with sand or 3/8 quarry screenings
4. Install 2-3 ft wide strip of gas vent GDL over pipe on slope.
5. Place gas vent GDL over entire subgrade per design. In locations where GDL is required install GCL in lieu of gas vent

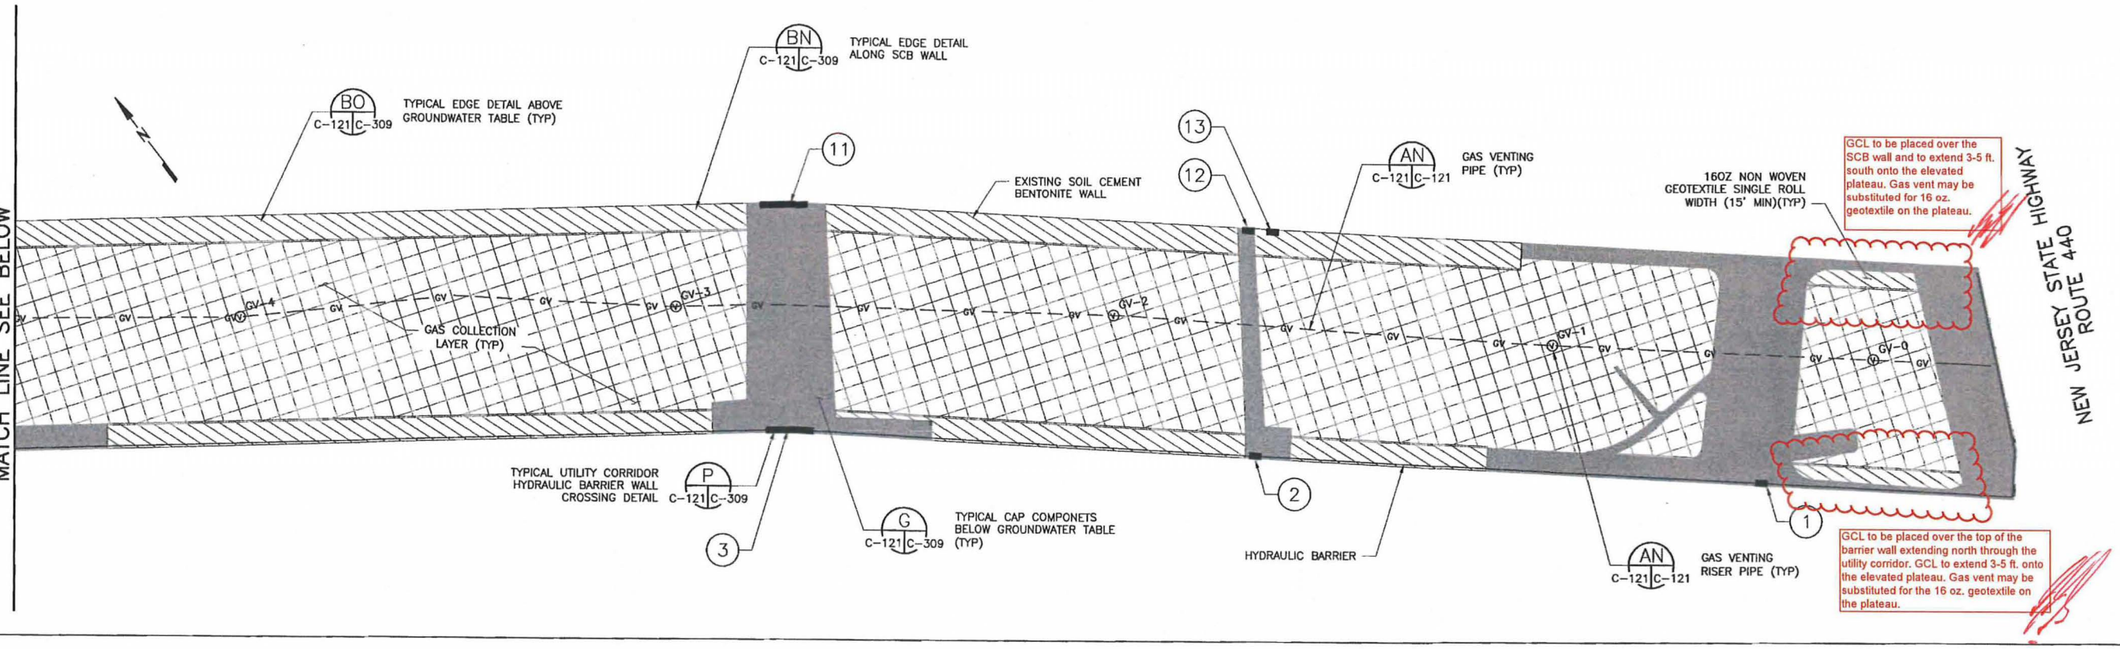
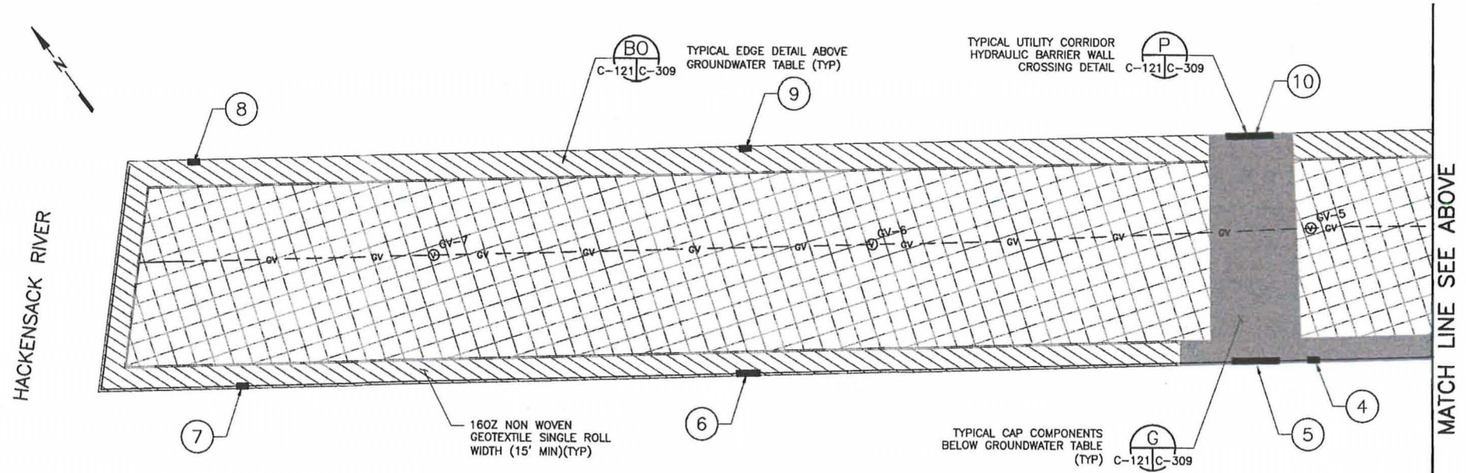
**FINAL DCB 035.3 – GCL AND GEOTEXT CLARIFICATION**

DESIGN CHANGE BULLETIN



| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 35.3 **DCB Type:** Minor (a)<br>**Effective Date:** 10/06/15 |
| **Project Location:** SA-6 South | **Associated RFI:** |
| **Title:** Revised Gas Venting System and Cap Details | ☑ Yes, RFI No. 60 ☐ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |



**Description.** This DCB was prepared in response to RFI-060 regarding the strip of 16 oz. geotextile adjacent to the SCB wall and Barrier Wall as shown with the red balloon in the attached annotated PDF of C-121 (rev 4, 8/13/15). This area was inspected in the field and this DCB serves to verify direction provided by the EOR at that time.

GCL is required to be installed over the SCB wall and Barrier Wall at these locations as shown. The GCL serves to protect the geomembrane from the Barrier Wall/SCB walls and acts as a redundant hydraulic barrier under the geomembrane in areas where the geomembrane may be immersed below the groundwater. The GCL should extend from the walls and associated utility corridor onto the elevated subgrade plateau where the 16 oz. geotextile is shown. It is acceptable to substitute either GCL or Gas Vent layer for the 16 oz. geotextile. A substitution using the materials noted will have no impact on the remedy.

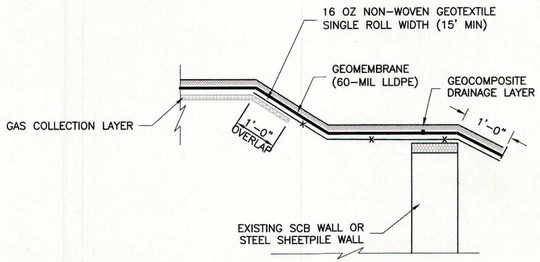
**FINAL DCB 036 – REVISED C-309**

DESIGN CHANGE BULLETIN

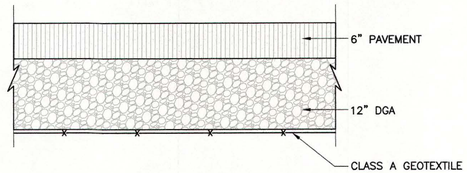
| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 36 **DCB Type:** Minor (a)<br>**Effective Date:** 7/22/15 |
| **Project Location:** SA-6 | **Associated RFI:** |
| **Title:** Revision to Detail BN Sheet C-309 | ☐ Yes, RFI Nos. ☑ None |
| | **Project No.:** 3480130377 |
| **Contractor (Subcontractor):** ENTACT | |

**Description**



Detail BN has been modified to extend the LLDPE up and over the SCB Wall. The prior detail showed both the GDL and geomembrane terminating at the wall.

Extending the LLDPE over the SCB wall raise the connection above the water table and perimeter pool elevations and a "below groundwater connection condition" and the related sand bentonite connection detail below the GCL as shown on the Rev 3 dated 5/27/15 BN detail.



The submerged detail (Detail G) will still be required where the GCL overlaps the sheetpile Hydraulic Barrier. This does include the "sand bentonite plug". The Bentonite to Sand ratio shall be a nominal amount of 8% bentonite by weight. The Bentonite should be a sodium bentonite, min 90 BBL yield, equal or better than Baroid Aquagel.

**FINAL DCB 037 – DETAIL CD DWG 304**

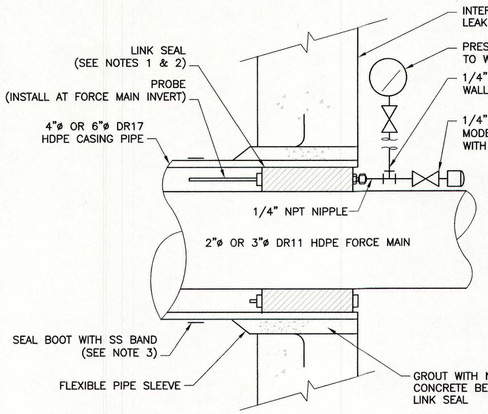
Honeywell RES

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 37 **DCB Type:** Minor (a)<br>**Effective Date:** 7/28/15 |
| **Project Location:** SA-6 | **Associated RFI:** |
| **Title:** Add notes to Detail CE to address above and below GW connection detail | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description**

**Detail CE Drawing C-304.** Sheet 304 is reissued to include the changes noted below on Detail CE. As with many other components in the design this detail requires a submittal from ENTACT/ESI to show their proposed installation details. It is possible that the submittal may result in changes to the fastening method.



Detail CE, as issued, showed GCL under the LLDPE. GCL will only be placed under the geomembrane at locations where the connection detail is below the groundwater table. Gas Vent will be placed at all locations above the groundwater table.

Several revisions have been made as noted below. The notes and components added cover conditions where the connection detail may be below groundwater and where structures/connections are above groundwater. The following changes have been made.

- GDL has been shown above the LLDPE geomembrane.
- Notations have been added to indicate that Gas Vent layer will be used under the LLDPE where the connection is above groundwater and GCL where the detail is below the groundwater.
- The amount of slack was reduced from approx. 3 inches to approx. 1 inch. This reduction is based upon the fact that the site has already been surcharged and primary consolidation removed. One inch of slack is adequate to accommodate any secondary consolidation.
- Note added to indicate that the top of the boot will be a minimum of 6 inches above the groundwater table if the structure is located below the groundwater.

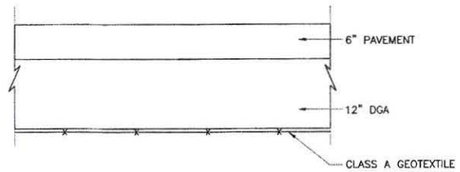
**FINAL DCB 039 – SUBGRADE SOIL WEDGE**



DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 039 **DCB Type:** (a)<br>**Effective Date:** 7/30/15 |
| **Project Location:** SA-6<br>**Title:** Corridor B SCB Detail | **Associated RFI:**<br>☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |
| **Description.** Entact was granted approval to install a wedge of soil in the B Street corridor against the SCB wall. There is a step up in this location from the corridor subgrade to the top of the SCB wall. The intent of the Entact request was to provide a more gradual transition between the corridor subgrade and SCB Wall. Amec reviewed the CHA utility drawings and determined that there were no utility structures within this location that would be impacted by the change i.e. the change has no impact on the future development, The remaining corridor to SCB wall detail will be installed as shown on the contract drawings. | |

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 041 **DCB Type:** Minor (a)<br>**Effective Date:8/19/15** |
| **Project Location:** SA-6 | **Associated RFI:** |
| **Title:** Warning Tape with Do Not Dig Markings | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.** Drawings C-301 1and CN-301 provide a Typical Utility Corridor/Hydraulic Barrier Wall Crossing Detail which calls for "Distinctive colored warning layer with markings in English and Spanish."

Entact Notified AmecFW that the vendor had experienced difficulty during set up and could not produce an acceptable quality of lettering on the orange non-woven geotextile (due to ink blurring).

As an option Entact proposed installing a standard direct burial utility marking tape.

AmecFW approved use of a 6 inch wide yellow PE tape with 3.5 inch bold back lettering as meeting the specified requirements for a distinctive colored high visibility marking. The tape will be placed at no more than 5 ft. on center.

| | |

RE: Warning Tape Certification/Warranty Statement

Dear Adam,

Please use this letter as confirmation that the polyethylene tape we have quoted for the Entact – Honeywell - Jersey City project is suitable for burial applications.

Polyethylene (PE resin) tapes are suitable for a buried warning barrier as they are inert and not biodegradable. Deterioration is only noted when PE is exposed to prolonged sunlight. PE does not migrate in soil and floats in water. PE produces no effects on aquatic or terra environments. When placed in landfills, they do not release gases or other compounds (known to pollute water resources.)

SPI warrants to the buyer that its products are free from defects in material and workmanship, but limits its obligation to replacement of the product. This warranty is in lieu of any other warranty, expresses or implied, including but not limited to any implied warranty of merchantability or fitness for a particular use, and of any other obligations or liability on SPI's part. SPI shall not be liable for any loss, damage, expense or consequential damages of any kind arising in connection with the use, or inability to use, its products.

If you have any questions or need further information on this or any of our products, please let Peter Daly @ IWT Cargoguard or myself know.

Best regards,

*Trish Righetti*

RE: Warning Tape Certification/Warranty Statement – Inks and Printing

Dear Adam,

Please use this letter in conjunction with our initial Certification/Warranty as confirmation that the inks used to print polyethylene tape we have quoted for the Entact – Honeywell - Jersey City project is suitable for burial applications.

Solvent inks are permanently adhered to the polyethylene tapes and (once ink is dry) can only be removed by applied, chemical means. This particular tape and ink combination was designed and been used as an underground marking tape for over 25 years with no quality or sustainability issues. We are confident in its performance for your current application.

If you have any questions or need further information on this or any of our products, please let Peter Daly @ IWT Cargoguard or myself know.

Best regards,

Trish Righetti

# 4 mil Mil PE Barricade Tape

I. SPECIFICATIONS:
Barricade warning tapes will consist of high visibility safety yellow or red polyethylene with bold black letters. Standard letter height minimum of two inches (2"+). Tapes help prevent accidents by increasing visibility of hazards and can be tied, stapled or nailed in place.

II. TEST DATA:
Material Identification: Nominal 4 Mil Polyethylene,
6" wide
Test Procedure: ASTM-D-882, Method A
Specimen Conditions: 73ºF / 50% R.H.
Test Temperature: 73ºF
Elongation: 552%
Tensile Strength (Transverse): 2,100 psi
Tensile Strength (Longitudinal): 2,870 psi
Roll Weight (6" x 1000') 9.0 lbs.

Suitable for burial

**FINAL DCB 042 – ANCHOR TRENCHES**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 042 **DCB Type:** Minor(a)<br>**Effective Date: 8/21/15** |
| **Project Location:** SA-6<br>**Title:** Anchor Trench Applicability | **Associated RFI:**<br>☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.** The anchor trench section of the Specification 02372 CAP GEOMEMBRANE LINER Section 3.02 is standard industry language and part of AmecFW's standard Geomembrane Specification. During the process of finalizing development of the capping system in the 100% Design, the Engineer determined that anchor trenches were not required for either the SA-6N or SA-6S Caps. As such, Paragraph 3.02 is no longer required and therefore the following is deleted in its entirety.

SECTION 02372

CAP GEOMEMBRANE LINER

3.02 ANCHOR TRENCH

A. The anchor trench shall be constructed as shown on the Drawings and/or as specified herein.

B. The anchor trench shall be adequately drained to prevent water ponding and softening of adjacent soils. The anchor trench shall be backfilled and compacted.

C. Geosynthetic material in the anchor trench shall be temporarily anchored with sandbags or other suitable materials until final approvals are obtained.

D. Backfilling of the anchor trench shall be conducted when the geomembrane is in its most contracted (taut) state.

E. Care shall be taken when backfilling and compacting the trenches to prevent any damage to the lining materials.

New Brunswick, NJ 08901-8551

September 17, 2015

To whom it may concern:

I was contacted by the Mr Shallard of ***Amec Foster Wheeler Environment & Infrastructure, Inc*** with regard to questions on the soil materials available for a NJ Project. Honeywell/AmecFW submitted results of analysis of Planting Soil samples from multiple vendors, selected from a list provided by Rutgers, for Horizon A, B and C that are under consideration for use on the SA-6 Project (refer to attached excel table). These data were to be used to select the vendor and soil products available for each of the soil layers to be used on the project. It is my understanding that multiple vendors have been contacted including those provided by Rutgers (email May 13th 2015) as potential sources and, that the list and samples provided, is indicative of what is available in the market place at this time.

While the list of criteria (Sand/Silt/clay/organics/pH) is applicable to all samples the importance of each of these criteria varies due to the intended purpose of each Horizon.
In my review I have identified samples listed which I consider acceptable, or acceptable subject to minor modification, to meet the project goals. The following samples are acceptable to accomplish the goals of the many design demands on this system.

Horizon A topsoil:
Nature's Choice (NC-TS-002-NCCWS) as the preferred or Nature's Choice (NC-TS-002-NCCW).
Both exceed the gravel percentage component of the specification, however one might envision the percentages as targets, and the excess of gravel in these cases does not change the functional behavior of the material for plant growth or drainage potential. NCCW has a higher organic component which is high enough to exhibit shrinkage as the organic materials decompose, so while a functionally acceptable soil material for the purpose, the shrinkage will be noticed on landscape edges next to structures such as sidewalks, thus CCCWS is preferred. The acceptable gravel content of the specification should be revised upward from 5% to <10%.

Horizon B:
Nature's Choice (NC-HC-001) would be a good choice, as the lower organic level is not problematic, and actually sets a natural layering and gradation as underlayment to the topsoil. The pH increases from 5.0 in the topsoil to 5.96, and I do not see this as an issue, several species may well prefer the nutrient availability afforded by the higher pH. One might consider adding some organic content and blending into the B horizon material. I am not in favor of the effort and expense, as the proposed layers will change in organic content and develop a natural progression on their own over time. The Sand % should be changed from a single number of 80% to a range of 80-90%. The pH maximum should be increased from 7 to 7.5. Organic content should be changed from a range of 1.5 - 3.5% to <4%.

Horizon C:
Nature's Choice Sample (NC-HC1-002) is very close to meeting the originally specified requirements. The Clay content is 12% as compared with the specified maximum of 15-20% and the pH was reported to be

RUTGERS
School of Environmental
and Biological Sciences

7.57 as compared with the 7.5 specified. These deviations are not considered to be significant. This sample will meet the original design objectives. The Clay Content specification should be broadened to 10-20% and pH specification modified to less than 7.7 to provide for consistency between the sample and specifications.
Advanced Soil Technologies (AST-HB-002) is also a potential candidate if the sand content could be reduced to <80%. The organic level is elevated, but not problematic. Organic content should be changed from 1% maximum to <4%.

Table 1 attached summarizes the proposed changes.

In total the three layers would be very reasonable for acceptable landscape growth expectations, and provide available moisture for plants and drainage potential in a normal manner *as long as the materials are not heavily compacted after placement by construction equipment.*

As with any project, the key to success will ultimately be in the construction management/traffic controls/equipment storage planning as related to the protection of the soil investment after placement. This will be particularly important with the landscape contractor equipment in planting the trees and other landscape elements, as much as with the pavement contracting for sidewalks and structures.

Respectfully submitted,

Jason Grabosky

Table 1 summarizes the modified criteria based on availability. Provision of soils meeting the criteria listed in Table 1 below will meet the objectives of providing soils that are suitable for the SA-6 project. These changes have been reviewed with the AmecFW Engineer of Record and it is recommended that both the project specification and Open Space Design Standard be amended as noted in the Table 1 below.

| SA-6 Planting Soil Specification-TABLE 1 | | | | | | |
|---|---|---|---|---|---|---|
| Revision 1 September 2015 | | | | | | |
| **Material SPEC 02315 SECT 2.12** | **Description (USDA soil triangle)** | **% Sand** | **% Silt** | **% Clay** | **% Organic Matter** | **pH** |
| Horizon A Modified | Friable Fertile Sandy loam/loamy sand | 60-80 | ▫20 | <20 | 3.5-6 | 5-6.5 |
| Horizon B Modified | Loamy sand | 80-90 | <10 | 10-15 | <4% | 5.5-7.5 |
| Horizon C Modified | Sandy loam to loamy sand | 70-80 | <10 | 10-20 | <4% | 5-7.7 |

1. *Horizon C. Clay content lowered from a minimum of 15% to a minimum of 10%. Organic content increased from <1 to <4%. pH content maximum increased from 7.5 to 7.7.*
2. *Horizon B. Sand changed from a single number of 80% to a range of 80-90%. pH maximum increased from 7 to 7.5. Organic content changed from a range of 1.5- 3.5% to <4%.*
3. *Horizon A. Gravel content increased from 5% maximum to <10%.*
4. *Soil Descriptions. The Planting Soil specifications include soil descriptions based on the USDA Soil Texture Triangle. Soils provided should be consistent with the Soil Texture Triangle.*

| SA-6 Planting Soil Specification-TABLE 1 | | | | | | |
|---|---|---|---|---|---|---|
| Revision 1 September 2015 | | | | | | |
| **Material SPEC 02315 SECT 2.12** | **Description (USDA soil triangle)** | **% Sand** | **% Silt** | **% Clay** | **% Organic Matter** | **pH** |
| Horizon A Topsoil | Friable fertile loam, fine sandy loam or sandy loam | -- | -- | -- | 3.5-6% | 5.0-6.5 |
| Horizon A Modified 9/16/15 | Friable Fertile Sandy loam/loamy sand | 60-80 | <=20 | <20 | 3.5-6 | 5-6.5 |
| Horizon B | Sandy Loam | 80-85% | ≤10% | 10-15% | 1.5-3.5% | 5.5-7.0 |
| Horizon B Modified 9/16/15 | Loamy sand | 80-90 | <10 | 10-15% | <4% | 5.5-7.5 |
| Horizon C | Uniform Sandy Loam | 70-80% | ≤10% | 15-20% | 1% max | 5.0-7.5 |
| Horizon C Modified 9/16/15 | Sandy loam to loamy sand | 70-80 | <10 | 10 – 20% | <4% | 5-7.7 |

1. *Soil Descriptions. The Planting Soil specifications include soil descriptions based on the USDA Soil Texture Triangle. Soils provided should be consistent with the Soil Texture Triangle.*

2.12 PLANTING SOILS

Planting Soils have been designated as Horizon A, B and C. Soil Horizon A – Topsoil will be a nominal thickness of 6 inches and shall conform to the requirement noted below.

A. Topsoil - Topsoil shall be placed over the Horizon B and C planting soils to final development grades shown in the design drawings. Topsoil will have a nominal depth of 6 inches. Topsoil shall be in accordance with Section 02900, "Topsoil and Seeding". Topsoil shall be certified clean from the borrow source or origin, based on analytical testing data, as approved by the Engineer. Topsoil shall be natural, friable, fertile loam, fine sandy loam or loamy sand with an organic matter content of 3.5% - 6% and a pH range of 5.0 – 6.5. Sand 60-80%, Silt ≤20%, Clay <20%. Specification 02900 requires that all materials pass a 1.5 inch sieve. Spec 02900 will be modified to allow <10% Gravel.

B. Soil Horizon B - soils will only be used in areas where the total depth of cover soils exceeds 36 inches. During the Interim Phase no Horizon B soil will be placed. Horizon B soils will be a loamy sand having the following properties:

Loamy Sand classification having ~~80~~ 80-90% sand, < 10% silt, 10-15% clay.
pH range 5.5 – 7.5 ~~7.0~~.
Organic Matter (by weight) ~~1.5-3.5~~ < 4 %

C. Soil Horizon C – During Interim Grading Horizon C Soil will be placed between the root barrier and the Horizon A soil. The first 6 inches of Horizon C soils to be placed directly above the root barrier will be compacted to a minimum 90% of Standard Proctor. To meet Final Grading and planting requirements Horizon A soils will be stripped as necessary and Horizon C soils shall be re-graded to provide an appropriate depth of 18 inches. Horizon C soil shall consist of sandy loam to loamy sand having the following properties:

1. Sandy loam to loamy sand classification with 70-80% sand, <10% silt, ~~10 – 15%~~ 10 - 20% clay.
2. pH range 5.0 – 7.7 ~~7.5~~.
3. Organic Matter (by weight) ~~1~~ < 4 % ~~max~~.

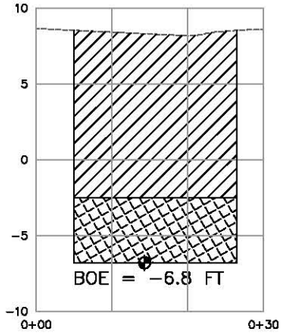
DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** **DCB Type:** Major (a)<br>**Effective Date:** 9/28/15 |
| **Project Location:** SA-6 South, Site 163<br>**Title:** Site 163 Excavation | **Associated RFI:**<br>☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |



**Description:** Chromium-impacted soils within the residential footprint of Site 163 that remained at levels above 20 ppm hexavalent chromium after in-situ treatment will be excavated in lieu of additional in-situ treatment and further sampling. The residential footprint includes the area north of the northern curbline of the future River Front Park/Riverside Drive/Kellogg Street to be constructed during the Bayfront Redevelopment project. A plan view and cross sections of the excavation area are included in the attached Figure 1. Soils that were treated successfully will not be subject to excavation or to further sampling. The remaining chromium-impacted soils identified in the area south of the northern curbline are within the future River Front Park/Riverside Drive /Kellogg Street as depicted on the attached Figure 2 and will be subject to a deed restriction and not be subject to further sampling.

NOTES:

1. HONEYWELL WILL EXCAVATE THE AREA DEPICTED ON THIS FIGURE AND IS PLANNING LOGISTICS WITH IT'S CONSTRUCTION MANAGEMENT TEAM AND REMEDIAL CONTRACTOR(S).
1. UNDER THE EXCAVATION SCENARIO, HONEYWELL WILL CONTINUE TO EVALUATE USING SHEETPILE FOR TEMPORARY EXCAVATION SUPPORT, BACKSLOPING, OR A COMBINATION OF BOTH.
2. OVERBURDEN MATERIAL WILL BE EXCAVATED, STOCKPILED, AND HANDLED IN ACCORDANCE WITH THE APPROVED SOIL MANAGEMENT PLAN IN THE 100% DESIGN.
3. CHROMIUM−IMPACTED MATERIAL WILL BE EXCAVATED, STOCKPILED, AND HANDLED IN ACCORDANCE WITH THE APPROVED SOIL MANAGEMENT PLAN IN THE 100% DESIGN.
4. BACKFILLING WILL OCCUR UPON VERIFICATION BY INDEPENDENT THIRD PARTY LICENSED LAND SURVEYOR THAT HORIZONTAL AND VERTICAL EXTENTS OF EXCAVATION HAVE BEEN ACHIEVED.
5. HONEYWELL MAY IMPLEMENT THIS EXCAVATION BY THE END OF 2015.
6. HONEYWELL MAY ELECT TO USE A CONTRACTOR OTHER THAN ENTACT TO IMPLEMENT THIS EXCAVATION ACTIVITY.
7. THE PROPOSED EXCAVATION FOOTPRINT IS 6,335 SF AND 5 BOTTOM SAMPLES SATISFIES THE NJDEP APPROVED FREQUENCY OF 1:1300 SF AS IDENTIFIED IN THE 100% DESIGN REPORT.

**FINAL DCB 048.1 – SA-6S SITE 163 EXCAVATION SURVEY**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 48.1 **DCB Type:** Minor (a)<br>**Effective Date:** 12/21/15 |
| **Project Location:** SA-6 South, Site 163 | **Associated RFI:** |
| **Title:** Site 163 Survey Control | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.** Amec Foster Wheeler (AmecFW), Entact and Maser Consulting have developed alternative methods for documentation/survey of the excavation bottom in Site 163. The alternative methods were developed in light of safety considerations for surveyor access into a sheet piled excavation to elevation –8.0. The bottom of the excavation will be in very low strength Stratum O soils. These alternative survey control methods are different from those previously used in the SA-6 South Development Area.

The existing SOP requires "excavation to grade" using the Machine Control, followed by use of a GPS Rover to check grade by the Entact QC engineer, and finally the GPS Rover documentation survey of the Bottom of Excavation by Maser (the registered surveyor). Through this process a high level of confidence has been developed in the accuracy of the Machine Control.

The Site 163 SOP is based on the use of GPS based Machine Control for documentation of the bottom of excavation elevation.

SITE 163 EXCAVATION SOP

*Temporary Sheetpile will form the perimeter of the Cr excavation. The sheetpile limits have been designed to extend to the defined <20 ppm PDI Sidewall locations. The location of the installed sheetpile will be surveyed by Maser to document the lateral limits of excavation.*

*Excavation Equipment. The excavator used for survey documentation will be equipped with twin Trimble Model MS990 Receivers and Model CB430 Display. The Model MS990 Receivers are linked to a Model SPS852 Base Station located on the project site.*

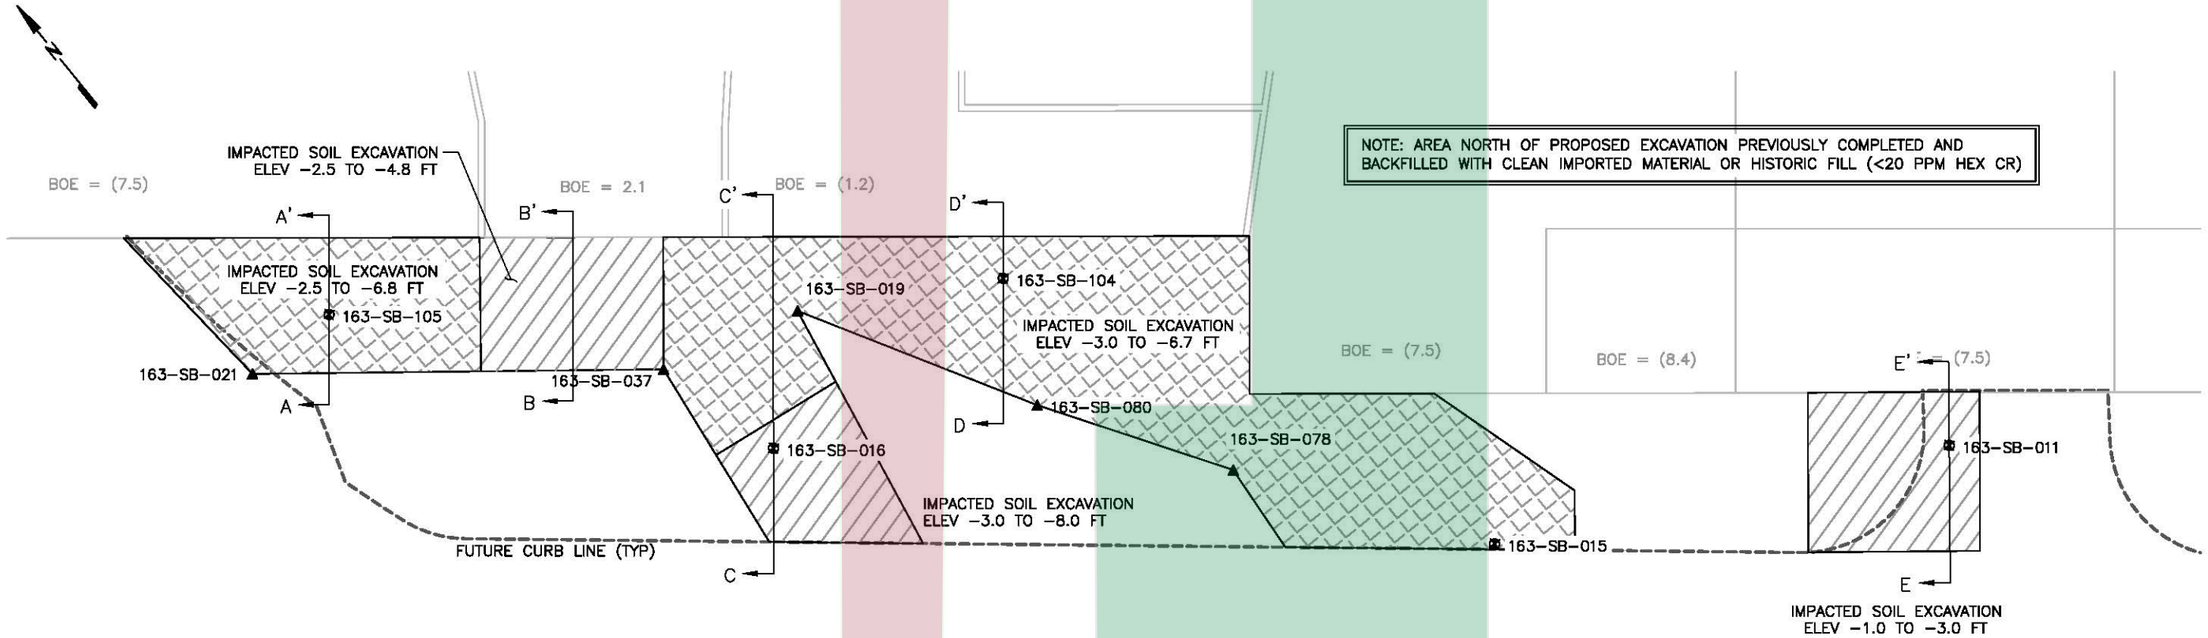
*Excavation: During excavation, Entact will conduct a daily calibration check at ground surface prior to excavation. Entact QC will verify the bottom of excavation is at or below the design elevation by means of the Machine Control.*

*When the design bottom elevation has been reached, calibration will be rechecked in the presence of the Maser Surveyor.*

*Following the Surveyor Calibration check, the following steps will be performed:*

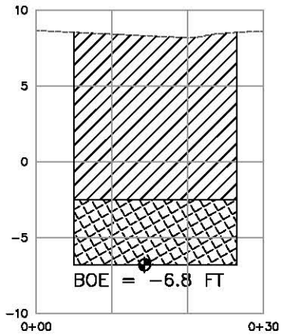
- *The bucket will be set at the "Bottom" PDI points and the elevations recorded.*
- *Elevations (Z) will be recorded at locations (X,Y) designated by the Surveyor, based on the Surveyor's professional opinion of the number and location of points that are necessary to generate the required Bottom of Excavation Topographic Map.*
- *If Stratum D is observed, readings will be taken to record the "plan" limit of the Stratum D.*
- *The above information will be entered into the Excavation Table to be signed by Maser.*

*Excavation Submittal: Due to the small size of Site 163, a single submittal package will be prepared and submitted by Honeywell to the Special Master and Plaintiffs.*



*The submittal will include:*

- *Excavation Table listing all Bottom PDI points*
- *Excavation Plan (Entact) showing limits of excavation, PDI locations and spot elevations.*
- *Summary Statement regarding observations (Honeywell/AmecFW)*



For inclusion in the Declarations, Maser will also prepare a bottom of excavation topographic map which will also show the limits of excavation (sheet pile alignment).

**FINAL DCB 050 – WARNING TAPE ABOVE ROOT BARRIER**

Honeywell RES

Honeywell.com

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 50 **DCB Type:** Minor (a)<br>**Effective Date:** 10/02/15 |
| **Project Location:** SA-6 North and South | **Associated RFI:** |
| **Title:** Warning Tape above Root Barrier | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.** ENTACT installed warning tape above the geocomposite drainage layer (GDL), as called for in Drawings C-301 and CN-301. As an additional precautionary measure, ENTACT will install warning tape directly on top of the root barrier layer. The warning tape will generally be installed perpendicular to the warning tape above the GDL. On the steep slopes into roadway/utility corridors and the tree planting areas the tape will be set running from the top of the slope to the bottom of the slope.

The warning tape will be the same tape used above the orange GDL warning fabric, i.e. a 6 inch wide yellow PE tape with 3.5 inch bold back lettering which meets the specified requirements for a distinctive colored high-visibility marking. The tape will be placed at no more than 5 ft. on center.

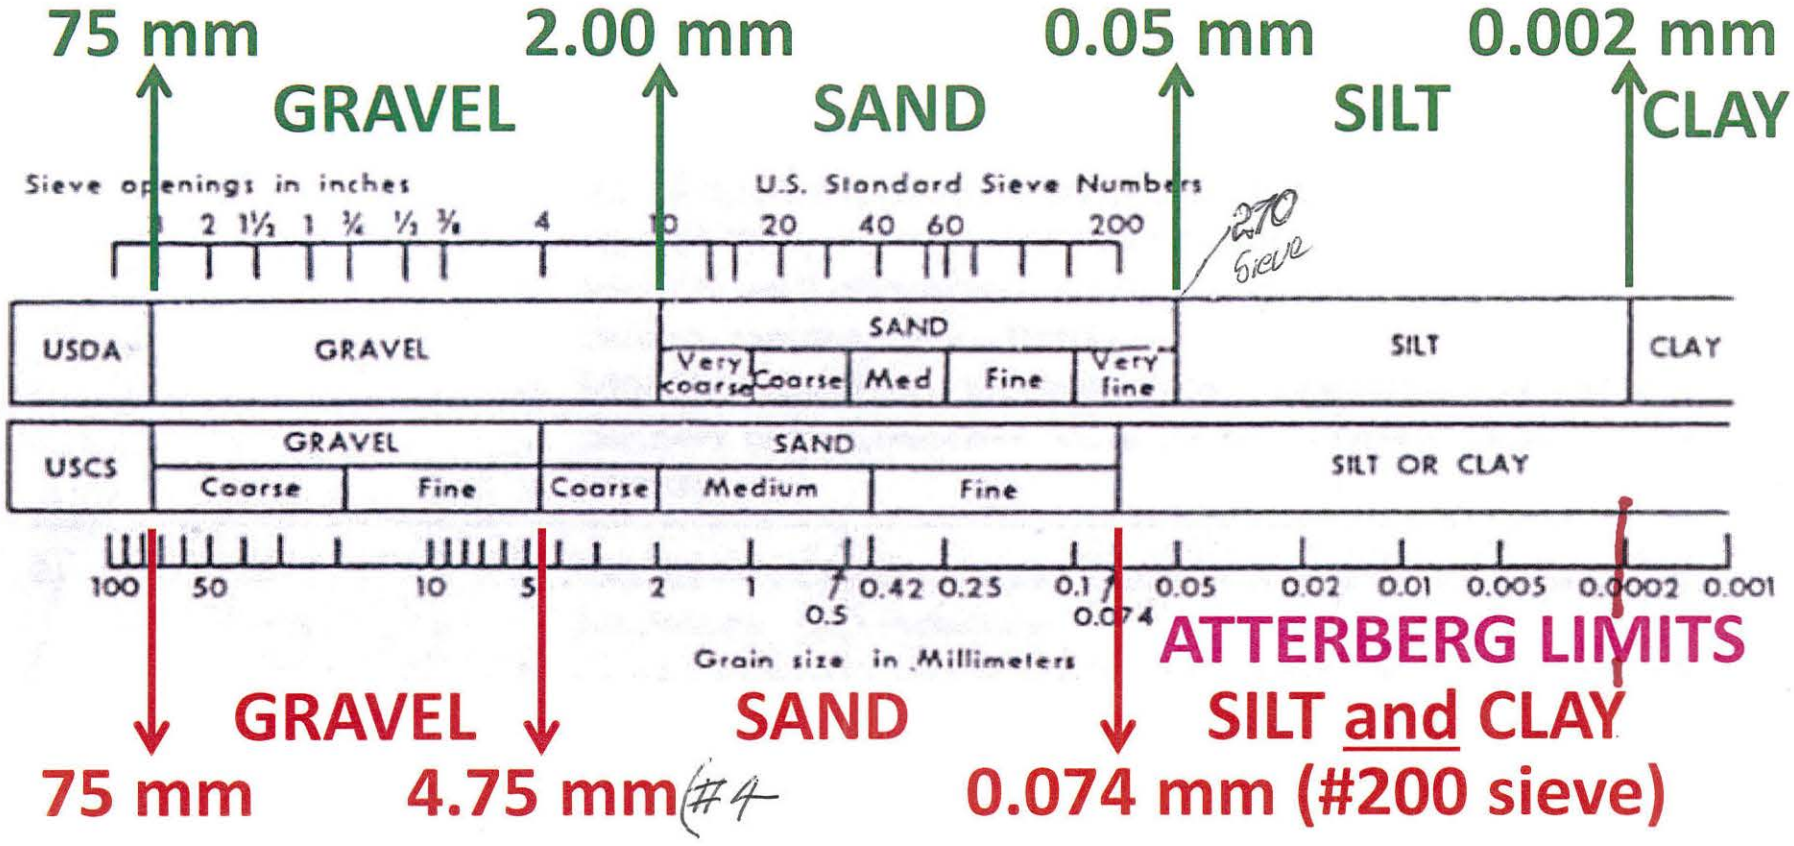
| **Title:** Planting Soil Gradations USDA Clarification | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description.**

The laboratory results of all gradations for planting soils shall be presented in terms of the USDA classification system rather than USCS.

The ASTM methodology, which includes hydrometer, remains the same, with the exception that a #270 sieve should be added to align with the USDA classification of silt at 0.05 mm.

The laboratory reports should clearly designate that the classification is based on USDA and any values stated for Gravel/Sand/Silt &Clay should also be calculated based on the USDA analysis.



The Specification values for the Horizon A, Horizon B and Horizon C soils are all defined based on the USDA Soil Classification. When calculating the Sand, Silt and Clay percentage, the Gravel component (% retained on the #10 sieve), should be removed from the calculation.

**FINAL DCB 057 – NATURE'S CHOICE – HORIZON C ONLY**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 057 **DCB Type:** Minor (a)<br>**Effective Date:** 03/21/16 |
| **Project Location:** SA-6<br>**Title:** Planting Soil Specifications (Nature's Choice - Horizon C ONLY) | **Associated RFI:**<br>☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |
| **Description.** Revisions to the Horizon C planting soil specifications for the Nature's Choice Horizon C Soil Source Only. | |
| **Reason for Change/Modification:**<br>☑ Unforeseen or Differing Site Conditions<br>☐ Design Revision<br>☐ Owner/Client Request<br>☐ Other | **Explanation or Reason:** See additional comments<br>**Attachments:** ☑ Yes ☐ No<br>Laboratory reports of chemical analysis<br>Cost Implication: ☐ Yes ☑ No<br>>$50k ☐ Yes ☑ No<br>Schedule Implication ☐ Yes ☑ No |
| **Additional Comments:** Nature's Choice was identified as the source that best met the physical requirements for Horizon C soils by Dr. Grabosky; however, several samples of Nature's Choice Horizon C soils have hexavalent chromium concentration >1.0 mg/kg. Consequently, Honeywell is proposing a design change to allow the hexavalent chromium concentration in Nature's Choice Horizon C soils to be less than 1.8 mg/kg, as agreed to by the Parties. For future sampling, hexavalent chromium soil samples will be composited from 10 grab sample locations per 5,000 CY (maximum). There are additional conditions in Attachment A that are part of this DCB and specific to Nature's Choice Horizon C soil. All other requirements specified in the 100% Design for imported soils will be met by the Nature's Choice Horizon C soils as amended in previous DCB 046. | **Design Documents Affected:**<br>Specification 02315, Section 2.12.C<br>Open Space Design Standards, Section 2.1.2 |
| **Honeywell (AP) Review:**<br>**Individual:** Geoff Shallard **Discipline:** EOR | **Initial:** **Date:** 4/26/2016 |

(b)– If DCB is to result in a CCO, follow the CCO process and provide a SOW and cost estimate.

# Attachment A – Supplemental Requirements for DCB 057

During the March 17 teleconference, Honeywell explained that the proposed material would come from an excavation pit (with concentration characteristics similar to those from which data was previously collected). Based on the information provided by Honeywell, plaintiffs will accept Honeywell's proposal to use the Nature's Choice material as Horizon C soils at Study Areas 6 North and South so long as Honeywell agrees to the following conditions:

1. Plaintiffs' agreement to use soils in excess of the 100% Design 1 ppm hexavalent chromium standard is limited to the Nature's Choice materials in question for use as Horizon C soils and is not a modification of the 100% Design standards as they apply to any future fill, repair or restoration work. This limited deviation from the 100% Design is set forth in this Design Change Bulletin.

2. The Nature's Choice materials shall contain less than 1.8 mg/kg hexavalent chromium. In addition, Honeywell shall use best efforts to maintain an average hexavalent chromium concentration as estimated based on the upper limit of the $95^{th}$ percentile confidence interval around the mean of 1.1 mg/kg in the Horizon C soils.

3. The Nature's Choice materials shall be sampled for hexavalent chromium no less frequently than once every 5,000 cubic yards. Hexavalent chromium sampling shall use composite samples that are made up of a minimum of 10 grab samples. The grab samples shall be collected as evenly as possible throughout the volume of material being sampled to ensure true representation of the hexavalent chromium concentrations coming onto the Study Area 6 sites.

4. All other sampling and analysis protocols will follow the customarily used NJDEP and USEPA protocols. To be consistent with the NJDEP protocols, one of the individual 10 grab samples will be used for all other required analytical parameters (VOCs, SVOCs, metals, etc.) to demonstrate compliance with clean fill requirements.

**FINAL DCB 058 – SA-6 SOUTH CP TEMP CONSTRUCTION ROAD**

Honeywell RES

Honeywell.com

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 058 **DCB Type:** Minor (a)<br>**Effective Date:** 5/6/16 |
| **Project Location:** SA-6 South | **Associated RFI:** |
| **Title:** Temporary Construction Road in SA-6 South Cap | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

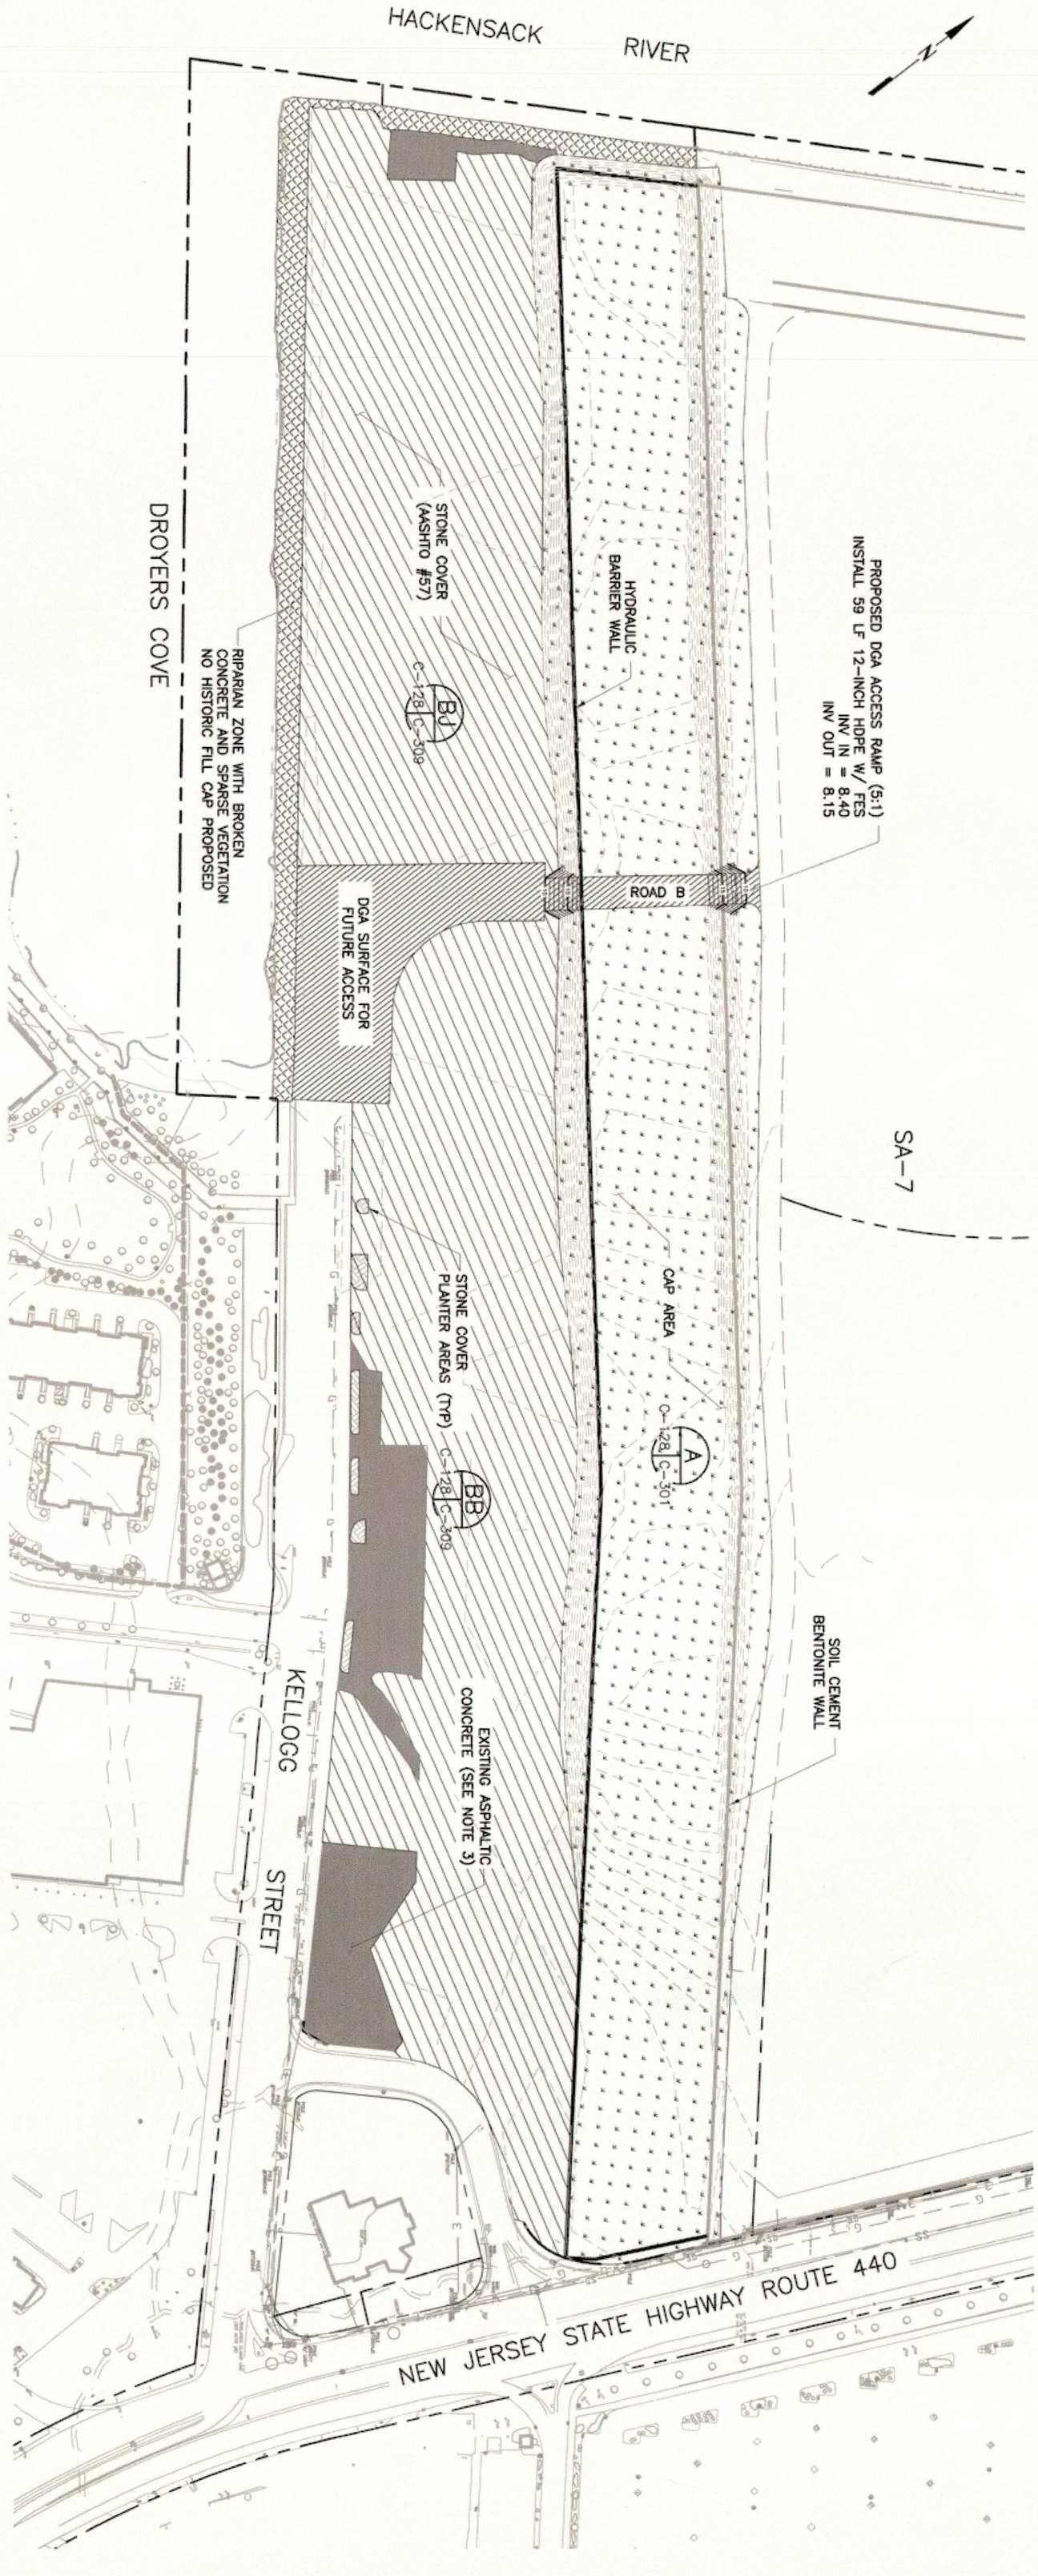
**Description.**

To allow for traffic flow within the project site following completion of the SA-6S Cap, a road will be installed within the "B Street" corridor.

The Chromium Remedy Design indicates that the Open Space AOC will be finished with topsoil and be seeded. Section 2.2.1.B of the Open Space Design Standards ("OSDS," Appendix L of the SA-6 North 100% Design Report) was written in anticipation of the need for "temporary construction roads" across the cap, post Chromium Remedy completion, and prior to construction of the final redevelopment roads. These construction road(s) will initially be used to provide access for general site inspections, access for the long term monitoring plan and maintenance activities such as mowing.

The roads will be constructed by continuing the "Structural Fill under Roadways to within 6 inches of final grade". The Topsoil shown within the construction road limits would be replaced with a load bearing geotextile (min 8 oz. non-woven) and 6 inches of Dense Grade Aggregate consistent with the OSDS "temporary construction road" requirements.

Table I of the OSDS was developed to show the minimum cover requirements for specific traffic loading conditions. The analysis supporting Table 1 was shared with the Plaintiffs during development of the OSDS. These communications were documented in Response to Plaintiff's Comments dated 07/13/2012. The calculation provided indicates that a 36 inch cover was adequate to provide protection of the cap when subject to H20 truck loading. When graded to the Chromium Remedy grades the typical fill depth in "B Street" is 8 ft. (OSDS Figure 4I is attached for reference). At the northern end of B Street, as the remedy surface transitions into SA-7, the minimum depth is 4 ft. These conditions meet the 36 inch cover requirement stated in Table 1.



The road as constructed during the Chromium Remedy will therefore meet Section 2.2.1.B of the OSDS.

**Table 1: Allowable Ground Pressure versus Fill Depth**

| Maximum Ground Pressure | Fill Depth Over Warning Layer/Liner |
|---|---|
| **Maximum Ground Pressure for Maintenance Equipment** | |
| < 5 psi | 12 inches |
| 5-10 psi | 18 inches |
| >10-40 psi | 24 inches |
| | |
| **Additional Maximum Ground Pressure for Temporary Roads** | |
| Fully Loaded Highway Truck (>40-80 psi) | 36 inches |
| | |
| **Permanent Roadways** | |
| No maximum ground pressure limit | 36 inches |

The load limits on temporary roads and on Landscape and Hardscape Areas allow for heavier loads where a rigid pavement or temporary load spreading system such as matts is used to spread the load and reduce the bearing pressures to below the limits specified in Table 1, and where a licensed New Jersey Professional Engineer has certified to Honeywell and Jersey City that the rigid pavement or temporary load spreading system will reduce the bearing pressures to below the limits specified in Table 1.

## E. Bearing Area – Foundations, Footers and Separation from Cap

1. Each point load from a Permissible Development Element shall have a minimum bearing area of 2 square feet except that traffic light poles and street light poles shall have a minimum bearing area of 3.5 square feet.
2. Each Permissible Development Element requiring a footer shall have a shallow footer.
3. Anchoring systems for Permissible Development Elements such as site furnishings shall be designed for surface mounting on spread footings. Hardscape areas shall accommodate surface mounted anchoring on spread footings.

Remedy and such certification will be included in a Development Plan reviewed and approved by the Special Master or the Federal Court. No curb and pavement box design shall be certified or approved unless it is demonstrated that it will not jeopardize the integrity of the Chromium Remedy.

8. Through trucks are prohibited on Roadways. Roadways shall be posted to prohibit through trucks. Jersey City shall prohibit through trucks and require the posting of such prohibition in an ordinance prior to the installation of the Roadways. The standard becomes effective upon the effective date of a Jersey City ordinance prohibiting through trucks on Roadways.

9. Every five years from the initial surfacing, a licensed New Jersey Professional Engineer shall inspect all Roadways in the Open Space Areas to evaluate whether the condition of any Roadway or segment thereof has compromised or is likely to compromise the structural integrity of the underlying subgrade or utilities. Within 30 days of the completion of the inspection, the licensed New Jersey Professional Engineer shall submit a certified report to Honeywell and Jersey City that describes the inspection undertaken and the repairs needed, if any, in order to address any condition that has compromised or is likely to compromise the structural integrity of the underlying subgrade or utilities. Within 18 months of the submission of the report, the repairs described in the report shall be completed. In the event that in the report the licensed New Jersey Professional Engineer deems a condition to constitute an emergency requiring immediate repair, such repair shall be made as soon as possible, and, if necessary, interim measures shall be employed to protect the cap, subgrade and utilities. Within 60 days of completion of the repairs, emergency or otherwise, a licensed New Jersey Professional Engineer shall inspect the repairs and certify that the repairs have been satisfactorily completed.

**B. Temporary Construction Roads**. The following requirements apply to all temporary construction roads:

1. In the event temporary construction roads are installed, these roads shall be limited to the locations designated for Roadways in the 100% Design on Drawings CN-515 and C-516. Temporary roads shall be installed using a load bearing geotextile fabric to isolate the wearing surface from the

subgrade. A wearing surface shall be installed that is sufficient to handle the intended temporary traffic loadings. Temporary roads shall be designed consistent with the projected loads and frequency. Temporary roads shall be designed to be protective of the Chromium Remedy. A licensed New Jersey Professional Engineer shall certify that the temporary road design is protective of the Chromium Remedy and such certification shall be included in a Development Plan reviewed and approved by the Special Master or the Federal Court. No temporary road design shall be certified or approved unless it is demonstrated that it will not jeopardize the integrity of the Chromium Remedy.

2. The load limitations specificed in Section 2.1.4.D of the OSDS and Section 02374 Part 3.3 G 7 of the Technical Specifications shall apply to all loads on the temporary roadways.

### *2.2.2 Hardscape Areas including Pedestrian Thoroughfare*

Hardscape Areas shall have a minimum separation of 12 inches between the Warning Layer/Liner and the underside of the hard surfacing. The surface and subgrade materials shall be of sufficient strength to accommodate Maintenance Equipment.

### *2.2.3 Utilities*

All utilities including those supporting the pump and treat system for groundwater remediation, with the exception of any extraction wells or collection trenches, shall be placed above the Cap as required in Paragraph 56(b) of the Study Area 6 North Consent Decree.

### *2.2.4 Utility Corridors*

**A. Public Utilities.** All public utilities shall be located in a designated utility corridor and shall be installed in accordance with Paragraphs 60(j)(v)(6) and (7) of the Study Area 6 North Consent Decree. The location of the utility corridors is shown on Drawing CN-515 of the Study Area 6 North 100% Design and C-516 of the Study Area 6 South 100% Design. During the Initial Development Period, the modification of designated utility corridors or the designation of additional utility corridors, if necessary shall be subject to the review and approval of Honeywell, Jersey City, and the Special Master.

**FINAL DCB 059 – HORIZON B AND C SOILS**

DESIGN CHANGE BULLETIN

| | |
|---|---|
| **Project Name:** Chromium Remedy Study Area 6<br>Jersey City, NJ | **DCB No.:** 059 **DCB Type:** Minor (a)<br>**Effective Date:** 4/20/16 |
| **Project Location:** SA-6 | **Associated RFI:** |
| **Title:** Planting Soil Specifications | ☐ Yes, RFI Nos. ☑ None |
| **Contractor (Subcontractor):** ENTACT | **Project No.:** 3480130377 |

**Description**. Planting Soil Source Acceptance Variance for Select Horizon B and C Soils.

DCB-046 expanded the ranges of acceptable physical parameters (gradations, pH and organic content) in Horizon B and C soils that were included in the Earthwork Specification 02315. DCB-046 was accepted by all Parties and Specification 02315 was revised accordingly.

Subsequent to the acceptance of DCB-046, Entact encountered difficulty locating available Horizon B and C sources that comply with the revised Specification and meet hexavalent chromium design criteria of 1 mg/kg or less.

This DCB-059 was developed to document an agreement reached by all parties on the Special Master All-Hands monthly call on April 19, 2016. Based on the agreement, Honeywell will proceed to import fill material from suppliers as noted below to support the project needs for Horizon B and Horizon C soils to meet the demands for fill quantity and schedule for cover soils on SA-6 South and North.

It is noted that an exhaustive search of potential sources resulted in a short list of potentially viable Horizon B and C sources being recommended, following consultation with Dr. Grabosky who provided his recommendations in correspondence dated March 17, 2016. Dr. Grabosky's recommendation is attached and made part of this DCB. The specific sub set of soil sources agreed to by all parties is as follows:

| Horizon B Approved Sources | Horizon C Approved Sources |
|---|---|
| Cedar Hill | Natures Choice (Per DCB-057) |
| EME - B001 | Impact - AB33 |
| Impact - AD17 | Impact - AD25 |

**DCB-059 applies to the completion of importing soils for SA-6 North and South grades as presented in the 100% design and does not permanently change the Earthwork Specification 02315 for physical parameters (gradations, pH and organic content) in Horizon B and C soils that were memorialized in DCB-046.**

March 17, 2016

To all concerned:

I spoke on the phone with Geoff in between meetings during the past week. For all concerned, there was a delay in this set of conversations due to some snags in our e-mail communications (I was not getting e-mails through my server for some reason), but we developed some work arounds to share the soils tables under review and spoke during a brief conversation on Tuesday Morning from 8:00-8:15 a.m. once I had the soils tables in front of me while chatting over the phone.

There are issues with the Nature's choice source, in terms of supply and in terms of some testing results. For that reason, it has been necessary to identify alternative Horizon B and Horizon C sources. To reduce risks in material supply, chemistry and gradation, I have identified multiple sources/mixes for both Horizon B and Horizon C. In making specific recommendations I also considered both the expense of shipping, and the environmental cost (or the carbon footprint) in shipping, and the limitations in time management from the haulage/transportation logistics.

**Horizon B:**
In a technical sense, Nature's choice remains an approved and acceptable layer B material. However, there is an open question of availability of material in the volume needed for project execution.

The Cedar Hill material can fit the B Layer source designation. Clay is at 10% right at the lower end of the clay specification. As discussed with Geoff Shallard, in an engineering/drainage view, this is a good material. We would also have to consider a lower the min clay value in the specification to account for variability. The pH of this material (6.22) seems to be in line with the goals for the specification. Given a concession in lowering the clay content also opens consideration of the Impact Materials.

Impact AD17 : While the fines (silts and clays) are flipped from a best case scenario (and thus falling out of specification), the material would suit for the B horizon. In the clay component, this material is comparable to the Cedar Hill material. The silts exceed the specified maximum percentage. However, this maximum is largely in consideration of frost heave susceptibility. For the depths of the B layer relative to expected frost penetration to depth in Jersey City, especially in consideration of all future climate predictions of warmer temperatures, the frost potential is deemed less critical. Indeed, the pH is a tad high, but not so much as to consider it unworkable from a horticulture management sense. The sand portion of the Impact AD17 blend (which is the bulk of the blend) sits 10 minutes away from the site in Kearny, NJ and therefore has a low carbon footprint and ease of logistics. Additionally, it may yield a continuum in similarity if the C horizon also is determined to come from an Impact source.

EME B001-HORB: The EME grouping of materials benefit from a high level of control, and would be considered a useful source ***if*** the material could lower the organics to <4. Given the systems in question,

there is every possibility of shrinkage over time as the OM degrades, which could have negative impacts on the final developed site. A principal detraction of this source would be distance (about 65 miles), both in expense in shipping, the environmental cost (or carbon footprint if you will) in shipping from and the limitations in time management from the haulage/transportation logistics.

**Horizon C**

Impact AB33 and Impact AD25: While the fines (silts and clays) are flipped from a best case scenario (and thus falling out of specification), the materials would suit for the C horizon. pH is in line with the specification. I have a preference for the AB33 for the lower pH and slight increase in clay, but both would be suitable. Of the materials in the tables, a discussion with Geoff indicated the sands in the Impact materials are coarse and to our benefit in workability and drainage capacity, which for the level of construction traffic on site, works toward the stability of the system in a physical-mechanical sense. The sand portion which is the bulk of the Impact blends also is located in Kearny, NJ and therefore has a low carbon footprint and ease of logistics.

EME B002-HORC: The EME grouping of materials benefit from a high level of control, and would be considered a useful source ***if*** the material could lower the organics to <4. Given the systems in question, there is every possibility of shrinkage over time as the OM degrades, which could have negative impacts on the final developed site. A principal detraction of this source would be distance (about 65 miles), both in expense in shipping, the environmental cost (or carbon footprint if you will) in shipping from and the limitations in time management from the haulage/transportation logistics.

**Recommendations:**
I would retain EME as a Vendor option for both Horizon B and Horizon C with an assumption the organic fractions can be reduced. While the materials seem very good, the costs likely outweigh the advantages for the B and C horizons. The vast majority of the plant root systems are in the A horizon, thus the goals for the lower levels are about support, drainage and depth/distance to cap. Given the timing and the difficulty associated with getting materials into conformance I make the following recommendations. Pragmatically, one might argue I am siding on convenience. However, upon the consideration of developing a system, I feel what we develop from the recommendations provides a working solution, albeit with a higher system pH than originally targeted. The plant palette was chosen to bias toward shallower rooting species, and the higher ph will encourage the proliferation of roots where the mineral nutrition is available, which biases toward the surface with the increased pH of the lower layers. We provide a loamy-sand to sandy loam transition in the b to c horizon depths, which would provide a continuum for the water column through the layers provided compaction of each layer is not excessive and the interface blending described in the early documentation occurs. The increase of pH does not place the plant species selected into peril to my knowledge.

I would recommend:

Horizon B soils:

Adopt Impact AD17% as the primary source, and Cedar Hill as the secondary source. To accomplish this in specification language, adjust the B layer % Silt to <15% and % Clay to 5-15%. Raise acceptable pH to 7.6 from 7.5 or figure out how to lower the AD17 pH in the mix process.

RUTGERS
School of Environmental
and Biological Sciences

Horizon C soils:

Adopt Impact AB33% as the primary source. To accomplish this in specification language, adjust the C layer % Silt to <15% and % Clay to 5-15%. Retain the Impact AD25 as an alternative to Impact AB33%.

Respectfully submitted,

Re: Study Areas 6 North and South – DCB 2016-3-18 Horizon B and C Soil Specifications

Dear Jeremy:

We write to provide plaintiffs' position with respect to the Design Change Bulletin (DCB) DCB 2016-03-18 that seeks to modify the geotechnical specifications for Horizon B and C soils, which the parties previously modified in September 2015. We note that, like the September 2015 modification, the current proposal of Honeywell would apply to all Horizon B and C soils to be brought to the site, not just in the initial phases of development, but permanently. As set forth in the 100% Design and the Open Space Design Standards (OSDS), there is to be a distinction between the characteristics of the soils in Horizon B and Horizon C to ensure the growth of only appropriate types of vegetation and trees on top of the cap, so as not to endanger the cap. *See* Technical Specification 2315 Earthwork, 2.12 Planting Soils; OSDS 2.1.2 Restrictions on the Use and Placement of Fill, Subsection D Specific Requirements for Fill Soils in Landscaped Areas.

On April 7, 2016, plaintiffs requested additional information regarding the planned schedule for the importation and use of the Horizon B soils. Honeywell provided the requested information on April 12, 2016. Plaintiffs and their experts have reviewed the April 12 response. Plaintiffs agree with Honeywell's analysis that Horizon B soils may be imported and placed now in the Study Area 6 South Open Space, and that Horizon B soils cannot be placed in the Study Area 6 North Open Space until the redevelopment.

Plaintiffs understand that Honeywell wishes to have multiple sources of Horizon B and C soils available for use so that it will not incur delays such as those incurred this winter with respect to Horizon C soils. However, Honeywell is proposing to change permanently the geotechnical specifications for both Horizon B and C soils based on the analysis by Dr. Grabosky of particular sources for the Horizon B and C soils. Dr. Grabosky's analysis establishes that the particular soil sources that he recommends, based upon the potential sources

provided to him by Honeywell, will maintain the necessary distinction between the soil horizons even though the recommended sources may deviate slightly from the geotechnical specifications as modified in September 2015.

Based upon the recommendations of Dr. Grabosky as set forth in his correspondence of March 17, 2016, which was included with DCB 2016-03-18, as set forth below, plaintiffs will agree to the use at Study Area 6 of certain particular sources for Horizon B and C soils addressed by Dr. Grabosky, even though some of the sources may deviate slightly from the geotechnical specifications in the 100% Design for Horizon B and C soils. However, plaintiffs are not willing to agree to modify permanently the geotechnical specifications for the Horizon B and C soils of the 100% Design standards to accommodate use of the sources for Horizon B and C soils under consideration by Honeywell at this time.

Plaintiffs agree to the use of Horizon B soils for the Study Area 6 North and South Open Space areas from Nature's Choice, Cedar Hill, and EME (EME-B001 blend) because these sources meet the geotechnical specifications. In addition, plaintiffs agree to the use of Horizon B soils from Impact Environmental, which deviate from the geotechnical specifications, as a secondary source should the Nature's Choice, Cedar Hill, and EME (EME-B001 blend) soils not be available. Plaintiffs do not agree to the use of the EME (Horizon "B" Modified) soils because of the high organic material content of the soils.

Plaintiffs agree to the use of Horizon C soils for the Study Areas 6 North and South Open Space areas from Nature's Choice as set forth in DCB 2016-03-21. In addition, plaintiffs agree to the use of Horizon C soils from Impact Environmental (Impact AB33 and Impact AD25), which deviate from the geotechnical specifications, as secondary sources should Nature's Choice not be available. Plaintiffs do not agree to the use of the Horizon C soils from EME because Dr. Grabosky did not recommend the use of these sources and because of the high organic material content of those soils.

Plaintiffs' agreement to the use of certain Horizon B and C sources that deviate from the geotechnical standards, as set forth above, is not an agreement to modify the 100% Design standards as they apply to any future fill, repair, or restoration work. This more limited agreement to deviate from the 100% Design should be set forth in a modified Design Change Bulletin.

Please contact me with any questions. We look forward to your response.

Sincerely,

Bruce J. Terris

Civil Action No. 05-5993 Consolidated with Docket No 05-5955 under Docket No. 95-2097 (DMC)
Civil Action No 06-22 Consolidated with Docket No. 05-5955 (DMC) under Docket No. 95-2097

Civil Action No. 06-0022 (JLL)
(Consolidated under Civ. No. 05-5955 (JLL))

Initial SA-6 South Consent Decree Declaration

On August 14, 2012, the USDC DNJ entered into the First Amended Consent Decree Regarding Remediation and Redevelopment of Study Area 6 South ("SA 6 South Consent Decree"); pursuant to Article III, Honeywell may file one or more Declarations showing compliance with said SA 6 South Consent Decree. The Initial SA 6 South Consent Decree Declaration is filed by Honeywell with the consent of the other parties to memorialize Honeywell's partial compliance with the terms of the SA 6 South Consent Decree.

We, the undersigned, declare as follows:

1. William J. Hague, Director of Remediation Design and Construction for Honeywell International Inc. ("Honeywell") for Study Area 6 South (SA-6 South) New Jersey Department of Environmental Protection (NJDEP) Sites 073, 124, 125, 134, 140 and 163. Mr. Hague has direct responsibility on behalf of Honeywell for the management of remediation construction activities at SA-6 South related to the implementation of the Chromium Remedy as defined in Article III of the First Amended Consent Decree Regarding Remediation and Redevelopment of Study Area 6 South, filed August 14, 2012 ("Consent Decree"). Remediation and site restoration activities were performed in accordance with the Consent Decree, the NJDEP Technical Requirements for Site

Remediation, and the NJDEP-approved *Supplemental Remedial Investigation Report, Remedial Action Selection Report, and Remedial Action Work Plan for Chromium* to address chromium contamination at SA-6 South, dated December 23, 2008; NJDEP-approved *Supplemental Remedial Investigation Report, Remedial Action Selection Report, and Remedial Action Work Plan,* to address chromium contamination at Site 163 only, dated, May 18th 2012 (collectively referred to as the RAWPs), the SA-6 Chromium Remedy 100% Design Report dated June 28, 2013 ("100% Design"); and the 5 field changes that materially impacted the 100% Design, listed on page 4 and 5 of this Declaration (referred to herein as "Related Field Changes") with the continued oversight and supervision of the appointed Special Master. The SA-6 Chromium Remedy 100% Design, including Design Drawings and Technical Specifications was developed consistent with the Consent Decree and NJDEP-approved RAWPs and was approved by all Parties. On June 12, 2013, the Special Master approved the SA-6 100% Design for submittal to the Court so that the proposed implementation of the remedy could start on time, subject to Honeywell's confirmation regarding several issues. On June 28, 2013 Honeywell submitted the Final 100% Design Submittal for the Study Area 6 North and South projects ("Final 100% Design").

2. The elements of the remedy that are the subject of this Declaration were substantially completed between July 2013 and March 31, 2015.

3. This is an initial Declaration. Future Declarations will document the work on the elements of the remedy set forth in the Consent Decree implemented or completed after March 31, 2015.

4. To implement the requirements of the Consent Decree, Honeywell retained AMEC Environment and Infrastructure, Inc. (now Amec Foster Wheeler) to design and coordinate the construction activities related to the Chromium Remedy of SA-6 South. Amec Foster Wheeler is the Engineer of Record for the design and implementation of construction activities related to the Chromium Remedy of Study Area 6 South. Mr. Joseph T. Clifford is a licensed Professional Engineer in the State of New Jersey, a Principal Engineer (Professional Engineer, NJ, GE38067) at Amec Foster Wheeler and is the engineer at Amec Foster Wheeler with primary responsibility for management of the design and construction coordination activities at SA-6 South.

5. For planning and implementation purposes, the work was divided into the following elements; excavation, barrier wall installation, backfill activities and soil management. Based on our professional opinion, the data and information set forth for the specific work elements noted in and attached to this Declaration -- excavation, barrier wall installation, backfill activities and soil management -- were performed consistent with the 100% Design and Related Field Changes.

Declaration #1 pertains to the following elements of the SA-6 South Chromium Remedy.

I. Excavation

II. Barrier Wall Installation

III. Backfill Activities

IV. Soil Management

Further details related to elements I-IV are provided below.

Supporting Documentation is provided in the Attachments.

Excavation. This Declaration addresses excavation of soils at SA- 6 South containing hexavalent chromium at levels greater than 20 milligrams/kilogram ("mg/kg") to meet the requirements of Paragraphs 59(a), (b) and (c) of the Consent Decree during the period of October 22, 2013 through December 22, 2014. SA-6 South was divided into two general areas as defined in the Consent Decree: the "Open Space Area of Concern (AOC)" and the "Development AOC".

Pre-Design Investigation (PDI) sampling and analytical results delineated the lateral and vertical limits of excavation and 156 15-foot wide cells were established to subdivide the SA6 South excavation for tracking and reporting. This PDI program was based on standards and conditions set forth in the RAWP, which was approved by the NJDEP, and supplemental discussions held during a January 11, 2012 meeting with the NJDEP wherein sampling frequency was discussed. The PDI sample results established the original depth(s) of excavation for an excavation cell or general area, with the understanding that if Stratum D (i.e., "meadow mat") was encountered or if other field conditions impacted achieving the design excavation depth, the excavation may be halted at a shallower depth.

Honeywell conducted the excavation operations as detailed in the SA-6 South Standard Operating Procedure (SOP) - Confirmation of Excavation Limits, dated March 3, 2014 (and including Honeywell's April 24, 2014 letter and attachments). In addition, Honeywell collected the survey data necessary to prepare a topographic map.

Following the excavation of distinct portions (or cells) of the excavation, the horizontal and vertical extents of the completed cells were surveyed and Honeywell submitted documentation confirming the completion of excavation. In their submittals, Honeywell summarized the activities undertaken to complete the excavation of the referenced cells as required by the 100% Design and included the following statement from Honeywell's engineer, Amec Foster Wheeler: "Amec inspectors certify to the best of our technical ability

that impacted soils as defined in the 100% Design have been removed and that the requirements to allow backfilling had been met." Honeywell also noted, where applicable/appropriate, that the excavation in the referenced cells terminated [by depth] in the Stratum D and provided an Excavation Bottom Map that included the surveyed post-excavation bottom elevations for the cell(s). In addition, Honeywell provided an updated figure depicting the 156 cells comprising the SA6 South excavation that was used as an excavation progress chart, attached a figure of the excavation cells, and included an excavation bottom map. Honeywell further requested approval to backfill cells. During the course of the excavation, the Special Master acknowledged receipt of Honeywell's submittals and the notification that the contractor was ready to backfill the respective cells.

- The hexavalent chromium impacted soils in the SA-6 Development AOC were excavated so as to meet or exceed the lines and grades (i.e., lateral and vertical limits of excavation) established in the 100% Design and Related Field Changes. A topographic map of the bottom of the excavation is provided on the Drawing titled "SA-6 South As-Built Excavation Plan," Drawing No. C-111 – Excavation Plan (Attachment A-1) and prepared by R. Thomas Hugg NJ Professional Land Surveyor.
- The extent of Stratum D exposed by the excavation is also shown on the SA-6 South As-Built Excavation Plan, Drawing No. C-111 (Attachment A-1).
- The Limits of Excavation are shown on a drawing titled "Figure 1.1 - SA-6 South As-Built Limit of Excavation Map" (Attachment A-2).
- The horizontal and vertical limits of excavation were adjusted in several areas. The adjustments were documented in the following field changes that were submitted to Plaintiffs and the Special Master in the form of emails or Design Change Bulletins:
    - Proposed Bottom of Excavation Elevation (dated, 2013-12-12)
    - Increase Excavation from 3 to 4 feet Below Grade at Site 163 to Reduce In-Situ Treatment of Shallow Soils (dated, 2014-05-06)
    - Deferral of Concrete/Asphalt Berm along Bulkhead at Site 073 (dated 2014-5-19)
    - Deferral of Excavation along Bulkhead at Site 163 due to Unanticipated Subsurface Concrete and Steel Structures (dated, 2015-01-23)
- Excavation tables which document the PDI locations and depths and actual excavation depths are provided in Attachment B. Three sets of tables are provided. Attachment B-1 addresses the eastern portion of the main excavation area starting at Route 440 moving west. Attachment B-2 addresses the remainder of the main excavation area up to the "deferred Area" by the bulkhead. Attachment B-3 addresses the excavation areas at Site 163.

- Attachments B-1 and B-2 each contain three sets of tables. Tables 1.0 and 3.0 provide the coordinates of the PDI bottom and sidewall points and a comparison of the actual excavation depth and design depth at the established PDI locations. Table 2.0 tabulates the design elevation and final excavation elevation at the center points of the cells used for excavation control. Attachment B-3 includes Tables 1.0 and 3.0 (Table 2.0 is not included because the excavation cells were not extended into Site 163). The tables were prepared by R. Thomas Hugg, NJ Professional Land Surveyor.
- As presented in the 100% Design, the location of confirmatory analytical points developed during the PDI soil sampling were surveyed by a registered surveyor to verify that the excavation was carried to or beyond the confirmatory points. Attachments B-1 and B-2 provide a list of confirmatory points by cell and indicate the original coordinates and both the original and final grade elevations. An as-built figure of the excavation confirmatory points is provided as Attachment B-4.
- As demonstrated by completion reports prepared by Amec Foster Wheeler which have been periodically submitted to the Special Master, the bottom and lateral limits (and to the extent that an excavation cell bordered the perimeter barrier wall, the perimeter barrier wall as well) of each excavation cell were visually inspected by personnel from Amec Foster Wheeler for the potential presence of visible hexavalent chromium-impacted materials and/or any visually suspect ("anomalous") material. To the extent that additional hexavalent-chromium-impacted materials and/or visually suspect material were observed, Honeywell contractors conducted further removal activities until Amec Foster Wheeler inspectors were satisfied upon visual inspection that the materials had been removed and/or confirmation samples were collected to confirm that the requirements of the 100% Design for SA-6 South ("Approved Design") were met.
- Each cell identified in paragraph 3 has been excavated down to Stratum D or to the elevation indicated in the Approved Design. The bottom of excavation was surveyed by a New Jersey Licensed Surveyor and a plot of the survey results is included in Attachment A-1.

A drawing titled SA-6 South As-Built: Excavation Confirmation Points shows the PDI locations in plan view.

Items listed above will also be provided in the final Remedial Action Report.

I. Barrier Wall. The SA-6 South Chromium Remedy includes a containment system consisting of a vertical hydraulic barrier wall, a flexible geomembrane liner cap, and contingent groundwater pumping system. The vertical barrier wall "encloses" the Open Space AOC

utilizing the existing SA-7 Soil-Cement-Bentonite (SCB) Barrier Wall on the northern boundary and new steel sheet pile hydraulic barriers that have been constructed along the, southern perimeter of the Open Space AOC, the western perimeter (adjacent to the Hackensack River bulkhead), and along the eastern perimeter of the Open Space AOC (adjacent to Route 440). The steel sheet pile barrier wall was installed along the southern, eastern and western sides of the Open Space AOC and keyed into the meadow mat (Stratum D) or Stratum O to meet the requirements of paragraph 69(b) of the Consent Decree. Barrier wall driving commenced on August 15, 2013 and was completed on July 22, 2014. The barrier wall consists of welded pairs of sheets. The (connecting) field joints were sealed with a cement bentonite grout between Station 0+00 and Station 17+80 (east wall and eastern portion of south wall) and with hydrophilic sealant between Station 17+80 and Station 25+86 (west portion of southern wall and west wall).

- The Barrier wall was installed to the line and grade defined in the 100% Design and Related Field Changes.
- Field Change 2013-9-12, related to a minor straightening of the alignment and increase in cap area following acquisition of the "Boatyard Property" as part of Site 134.
- The top of the Barrier Wall is currently at the installed elevation consistent with temporary flood control and subgrade/surcharge requirements. The top of the wall will be trimmed to final elevations prior to cap deployment. The final elevations will be included in a supplemental Declaration.
- As-Built drawings of the Barrier Wall Plan and Profile are provided in Attachment C.

II. Backfill. Soil excavated from the Site is required by paragraph 67 of the Consent Decree to be replaced by backfill soil. Backfilling within the Open Space AOC includes the spreading/placing, compacting, and grading of onsite non-chromium impacted and chromium-impacted soils in accordance with the approved RAWP. Any backfill soil brought to the Site is required to either meet all applicable federal and NJDEP criteria, including NJDEP residential soil criteria, or comply with the beneficial soil reuse plan that is approved by the NJDEP and subject to review and comment by the Parties and approval by the Special Master.

- Compaction tables showing field compaction test results and a drawing showing test locations for work completed through March 31, 2015 are provided in Attachment D. Backfill compaction testing was performed as described in the SA6 South 100% Design, in accordance with the specifications set forth in NJDEP-approved SA 6 South RAWP and Soil Reuse Plan. The Final Site grading will be provided in a future Declaration.

- Drawing D-1 indicates the top of the backfill grade in the Development AOC as of March 31, 2015.
- Attachment D-2 comprises 5 drawings showing the locations of Backfill Compaction Test results conducted at the specified frequency of 1 test per 2,500 square feet of backfilled area. Attachment D-3 comprises tables summarizing Backfill Compaction Test results conducted at a reduced frequency of 5 tests per acre as provided for in the 100% Design Technical Specifications. If any area failed to meet the requirements for compaction, the area was reworked and retested. All test results are included. The final test result at every location met the specified compaction criteria.

III. Soil Management. Excavated soils were managed consistent with paragraph 59 of the Consent Decree from October 2013 through March 31, 2015. The Consent Decree provided for different soil management requirements for soils containing hexavalent chromium at concentrations greater than 20 mg/kg. The Soil Management Plan (SMP) (Appendix G of the 100% Design) establishes guidelines and the minimum requirements for the reuse and disposal of soil, concrete, and asphalt during the implementation of the chromium (and non-chromium) remedies at the Site.

Soils with a concentration of 1,000 mg/kg or greater of hexavalent chromium were removed from the site for disposal at Heritage Environmental Services, Indianapolis, in accordance with paragraph 59(a)i of the Consent Decree. Excavated soils with hexavalent chromium concentrations of 20-1,000 mg/kg were managed in accordance with the requirements of paragraph 59(b) of the Consent Decree. Petroleum contaminated soil containing less than 240 mg/kg and classified as non-hazardous was disposed at the Middlesex County Landfill and Bayshore Recycling or placed under the SA-6 South cap. Non-Hazardous mercury soil was disposed at the Middlesex County Landfill and Bayshore Recycling. Non-Hazardous Concrete was disposed of at the New Jersey Meadowlands Commission (NJMC).

The Summary of Soil Management Activities is tabulated in Attachment E. The Soil Management Activities table shows the disposition of the designated soil classifications, as defined by paragraph 50 of the Consent Decree, managed during excavation activities at SA-6 South as of March 31, 2015. Excavated soils used as subgrade fill and placed in the Open Space AOC were graded to the design subgrade following removal of the clean surcharge materials.

1. Based on our professional experience, the data and information set forth in and attached to this Declaration, and our supervision of the SA-6 South construction activities, we believe that hexavalent chromium-impacted materials greater than 20 mg/kg and as defined in the 100% Design have been removed from the excavated areas and areas on the perimeter barrier wall in the Development AOC in accordance with the Consent Decree and the Approved Design.

2. We certify that the foregoing is true and correct to the best of our respective knowledge.

William J Hague

**(DRAWING NO. C-111 – EXCAVATION PLAN)**

FILE NAME: C:\Civil 3D Projects\320151\Survey\Y-SURV-SA6S-FINAL.dwg PLOT DATE: Wed, 14 Oct 2015 PLOT TIME: 11:42 AM

**GENERAL NOTES**

1. THE SOLE PURPOSE OF THIS PLAN IS TO SHOW POST-EXCAVATION ELEVATIONS WITHIN THE SA6 SOUTH EXCAVATION AREA AT THE PROJECT SITE.
2. POST-EXCAVATION LOCATIONS AND ELEVATIONS WERE OBTAINED BY MASER CONSULTING P.A. ON MULTIPLE FIELD VISITS FROM 10/23/13 THROUGH 12/22/14. POST EXCAVATION SURFACES AND CONTOURS WERE GENERATED BY ENTACT AND CONFIRMED BY MASER CONSULTING P.A. WITH MINOR ADJUSTMENTS.
3. HORIZONTAL DATUM NAD 1983, VERTICAL DATUM NGVD29.

143-SB-43R: "R" designation indicates Reference Confirmatory Point for a designated Bottom Excavation Area. Coordinates come from Center Points within that specific cell.

1 This is the actual elevation of the PDI Bottom sample included in the 100% design.

143-SB-43R: "R" designation indicates Reference Confirmatory Point for a designated Bottom Excavation Area. Coordinates come from Center Points within that specific cell.

1 This is the actual elevation of the PDI Bottom sample included in the 100% design.

| Bottom Target Coordinates | | | | | As-built Elevations | | |
| Northing | Easting | Elevation 2 | Sample ID | Corresponding Cell # | Date Obtained | Elevation | Comments |
| 685092.3 | 601848.6 | Stratum D | C-113L | Lens Area | 12/8/2014 | -7.0 | Stratum D Reached |

2 This is the Bottom Elevation identified in the 100% design. It is one of the predetermined bottom elevations that correspond with the 9 excavation intervals shown in the design.

Green shading indicates 100% Design Bottom Elevation Field Modified to reach < 20 PPM soils .

3 Horizontal and/or vertical expansion of excavation due to visual inspection and analytical sampling resulted in removal of the PDI Sidewall Sample. The objectives of the 100% design and the target excavation limits were achieved.

4 Additional sidewall sample collected and analyzed to establish expanded excavation limit.

**Maser Consulting P.A. certifies that the elevations, with their corresponding date obtained, of the Confirmatory Points depicted in Table 1, Center Points in Table 2, Sidewall Confirmatory Sidewall Points Table 3 and Bottom of Excavation topographic spot elevations are correct, and representative of the as-built post-excavation grades throughout the corresponding excavation cells.**

2 Work adjacent the bulkhead had been deferred and will be completed in accordance with the Consent Order Consolidating the 100% Design for Study Area 6 North and Study Area 6 South filed into the court on July 9, 2013.

**Maser Consulting P.A. certifies that the elevations, with their corresponding date obtained, of the Confirmatory Points depicted in Table 1, Sidewall Confirmatory Sidewall Points Table 3 and Bottom of Excavation topographic spot elevations are correct, and representative of the as-built post-excavation grades.**

NOTES:

1. PLAN LOCATION AND TOP ELEVATION OF HYDRAULIC BARRIER BASED ON SURVEY COMPLETED BY ENTACT DURING INSTALLATION. ADDITIONAL SURVEY WILL BE COMPLETED WHEN THE HYDRAULIC BARRIER IS CUT TO FINAL DESIGN ELEVATION DURING LINER INSTALLATION.
2. BOTTOM OF HYDRAULIC BARRIER AND EXTENT OF EPOXY COATING BASED ON ENTACT TOP SURVEY AND SHEET PILE FABRICATION DRAWINGS. ALL SHEETS DELIVERED TO THE SITE WERE INSPECTED BY AMEC PERSONNEL TO VERIFY LENGTHS AND EPOXY COATING.
3. STRATUM D SHOWN FOR REFERENCE ONLY AND IS BASED ON GEOTECHNICAL BORINGS COMPLETED DURING THE PRELIMINARY DESIGN INVESTIGATION.

***Notes:*** Maximum Dry Density (gravel corrected) for Weldon WC QP based on Sor Testing Laboratories Report No. 13-2027 dated 12/9/13. Sample collected from on site soils.
Maximum Dry Density for Weldon WC Screenings based on Sor Testing Laboratories Report No. 13-1877 dated 11/6/13.
Maximum Dry Density (gravel corrected) for Tilcon MH DGA based on Sor Testing Laboratories Report No. 13-1334 dated 8/7/13.
Maximum Dry Density for Weldon LH Screenings based on Vertical V Laboratory Report No. 12643 dated 9/29/14.
Re-used on site historical fill material (Type A) will not be tested for compaction per Specification Section 02315-3.13 A.2.b
Moisture content not to exceed 3% above optimum per Specification Section 02315-2.04C
Bottom of excavation elevation based on Maser survey data (Center Point elevations)
Sample ID BF-01-01 where:

BF = Backfill (At frequency of 1 test/2500 SF)
01 = Test Location (as noted on Backfill Compaction Location Figure)
01 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again
= Area subject to re-compaction

* *Initial field testing indicated compaction of greater then 95% (see attached Sor Testing Lab (STL) memo). Laboratory results for initially provided Weldon WC QP sample indicated a maximum dry density of 136.7 pcf. Using this density the compaction results are greater than the 95%. Laboratory tests on later deliveries indicated density results of 142.6 pcf. This range is typical of what can be expected for this type of source. The Engineer of Record (EOR) directed that the results be reported using the higher more conservative value and that the STL field test report verifying the higher passing results be attached to the final documentation. It is further noted that the Design Documents do not designate this area for compaction as Structural Fill per Specification Section 02315 Section 3.12, Structural Fill 95%; Non Structural Fill 90% Standard Proctor. The 95% value noted in this Table was implemented to provide for uniform compaction in areas slated for future development. It is the EOR's opinion that these two samples meet the 100% Design and project requirements.*

| Subject: | In-Place Density Tests | | |
| Job No.: | 13-208 | Report No.: 13-1994 | Date: 12/3/13 |

At the request of the client, on November 22, 2013 a field technician from Sor Testing Laboratories, Inc. reported to the project site for the purpose of performing in-place density tests over previously compacted lifts of materials at locations indicated by the client's representative.

Using a nuclear density gauge, our technician performed two density tests at locations 01BF-2 and 02BF-2 per the client's instructions. The proctor value of 136.7 pcf at our optimum moisture content of 8.1% was also provided by the client.

Test results were 97.5% and 95.7% compaction.

Technician: J.C. Jean-Toussaint

Very truly yours,

SOR TESTING LABORATORIES, INC.

***Notes:*** Maximum Dry Density for Weldon WC Screenings based on Sor Testing Laboratories Report No. 13-1877 dated 11/6/13.
Maximum Dry Density (gravel corrected) for Tilcon MH DGA based on Sor Testing Laboratories Report No. 13-1334 dated 8/7/13.
Re-used on site historical fill material (Type A) will not be tested for compaction per Specification Section 02315-3.13 A.2.b
Moisture content not to exceed 3% above optimum per Specification Section 02315-2.04C
Bottom of excavation elevation based on Maser survey data (Center Point elevations)
Sample ID RF-01-01 where:

RF = Reduced Frequency
01 = Test Location (as noted on Backfill Compaction Location Figure)
01 = Number of test performed at that location (sequential)
R = Will be placed after sample ID if the test location is reworked and the compaction test is run again
= Area subject to re-compaction

# TABLE SUMMARY OF SOIL MANAGEMENT ACTIVITIES

**ATTACHMENT E**
**SUMMARY OF SOIL MANAGEMENT ACTIVITIES**

STUDY AREA 6 SOUTH
SA-6 CHROMIUM REMEDY
JERSEY CITY, NEW JERSEY

| Excavated Material Description | Approximate Excavation Volume (CYs) | Approximate Off Site Disposal Volume (CYs) | Approximate Reused As Backfill in Development Area Volume (CYs) | Approximate Volume Consolidated Under South Cap (CYs) | Approximate Volume Consolidated Under North Cap (CYs) |
|---|---|---|---|---|---|
| <20 mg/kg Overburden Non-Chromium-Impacted | 65,000 | 21,500 | 15,000 | 20,000 | 8,500 |
| 20-240 mg/kg Chromium-Impacted | 48,000 | 15,200 | 0 | 11,800 | 21,000 |
| 240-1,000 mg/kg Chromium-Impacted | 20,000 | 5,300 | 0 | 14,700 | 0 |
| >1,000 mg/kg Chromium-Impacted | 23,500 | 17,500 | 0 | 6,000 | 0 |
| Concrete | 6,500 | 1,500 | 5,000 | 0 | 0 |
| **Total** | **163,000** | **61,000** | **20,000** | **52,500** | **29,500** |

**Notes:**

1. 6,000 CYs (>1,000) consolidated under South cap is soil that was re-classified as <1,000 Hex Cr based upon stockpile reuse sampling results.
2. The volumes provided on this table are estimated and may be based upon conversion factors or other non-surveyed means of soil measurement procedures.

Second SA-6 South Consent Decree Declaration

On August 14, 2012, the USDC DNJ entered the First Amended Consent Decree Regarding Remediation and Redevelopment of Study Area 6 South ("SA-6 South Consent Decree"). Pursuant to Article III, Honeywell may file one or more Declarations showing compliance with the SA-6 South Consent Decree. The initial SA-6 South Consent Decree Declaration ("Declaration #1) was filed by Honeywell with the consent of the other parties to memorialize Honeywell's partial compliance with the terms of the SA-6 South Consent Decree on March 18, 2016. This second SA-6 South Declaration ("Declaration #2) is hereby filed by Honeywell with the consent of the other parties to memorialize partial compliance with the terms of the SA-6 South Consent Decree completed subsequent to Declaration #1.

We, the undersigned, declare as follows:

1. William J. Hague is Director of Remediation Design and Construction for Honeywell International Inc. ("Honeywell") for SA-6 South New Jersey Department of Environmental Protection (NJDEP) Sites 073, 124, 125, 134, 140 and 163. Mr. Hague has direct responsibility on behalf of Honeywell for the management of remediation construction activities at SA-6 South related to the implementation of the Chromium Remedy as defined in Article III of the SA-6 South Consent Decree.

2. Remediation and site restoration activities were performed in accordance with the SA-6 South Consent Decree, the NJDEP Technical Requirements for Site Remediation, the NJDEP-approved *Supplemental Remedial Investigation Report, Remedial Action Selection Report, and Remedial Action Work Plan for Chromium* to address chromium contamination at SA-6 South, dated December 23, 2008, the NJDEP- approved *Supplemental Remedial Investigation Report, Remedial Action Selection Report, and Remedial Action Work Plan,* to address chromium contamination at Site 163 only, dated, May 18, 2012 (collectively referred to as the RAWPs), the Chromium Remedy 100% Design Report for Study Area 6 North & Study Area 6 South dated June 28, 2013 ("SA-6 100% Design"), and three field changes (DC 2014-3-25 - "Contingent GW Extraction System: Replace Wells with Trenches," DC 2015-3-04 – " 3S Surcharge Pile Geometry on East End" and DC 2015-2-24 - "GW Extraction System: Revision to Geomembrane / Subgrade Surface") that materially impacted the 100% Design (referred to herein as "Design Changes"), with the continued oversight and supervision of the appointed Special Master. The SA-6 100% Design, including Design Drawings and Technical Specifications, was developed consistent with the SA-6 North & SA-6 South Consent Decrees and NJDEP-approved RAWPs and was approved by all Parties. On June 12, 2013, the Special Master approved the SA-6 100% Design for submittal to the Court, subject to Honeywell's confirmation regarding several issues. On June 28, 2013 Honeywell submitted the Final – Issued for Construction Chromium Remedy 100% Design Submittal for the Study Area 6 North and South projects ("Final 100% Design") to the Court, and the Court entered the 100% Design on July 9, 2013.

3. The elements of the remedy that are the subject of this Declaration were substantially completed between April 2015 and November 2015.

4. This is the second Declaration for SA-6 South. Future Declarations will document the work on the elements of the remedy set forth in the SA-6 South Consent Decree implemented or completed after November 2015.

5. To implement the requirements of the SA-6 South Consent Decree, Honeywell retained AMEC Environment and Infrastructure, Inc. (now Amec Foster Wheeler Environment & Infrastructure, Inc., "Amec Foster Wheeler") to design and coordinate the construction activities related to the Chromium Remedy of SA-6 South. Amec Foster Wheeler is the Engineer of Record for the design and implementation of construction

activities related to the Chromium Remedy of SA-6 South. Amec Foster Wheeler engaged Entact, LLC ("Entact") to perform the construction. Entact was responsible for implementing the SA-6 South construction in accordance with the Final 100% Design and Design Changes. Entact reported directly to Amec Foster Wheeler and provided the final construction details, including as-built drawings, upon project completion. Mr. Joseph T. Clifford is a licensed Professional Engineer in the State of New Jersey, a Principal Engineer (Professional Engineer, NJ, GE38067) at Amec Foster Wheeler and is the engineer at Amec Foster Wheeler with primary responsibility for management of the design and construction coordination activities at SA-6 South.

6. Based on our professional opinion, the data and information set forth for the specific work elements noted in and attached to this Declaration were performed consistent with the Final 100% Design and Design Changes.

7. Declaration #2 pertains to the following elements of the SA-6 South Chromium Remedy:

I. Contingent Groundwater Collection Trench,

II. Cap Subgrade,

III. Cap Geosynthetics, and

IV. Hydraulic Barrier Wall Final Elevation

Further details related to elements I-IV are provided below. Supporting documentation is provided in the Attachments.

I. Contingent Groundwater Collection Trench. This Declaration addresses installation of the Contingent Groundwater Collection Trench and associated manhole structures and piezometers to be used for documenting hydraulic gradients across the Barrier Walls at SA-6 South. The contingent groundwater system design was changed from a well-based collection system to a trench-based collection system in DC 2014-3-25. The trench was installed between May 22, 2014 and February 11, 2015 and is designed to meet the requirements of Paragraphs 69(c) of the Consent Decree. Piezometric pairs were installed to allow for the collection of groundwater elevation data to meet the requirements of Paragraphs 69(e) of the Consent Decree. The Contingent Groundwater Collection Trench is located within the SA-6 South Open Space Area of Concern (AOC).

The Contingent Groundwater Collection Trench runs along the east-west axis of the SA-6 South Open Space. The bottom of the trench is designed to be just above the top of the Stratum D soils. Groundwater modeling

indicated that the trench will be effective in meeting the capture zone specified in Section 69(d).

Honeywell collected the survey data necessary to document the plan and profile of the collection trench. The Contingent Groundwater Collection Trench Record Drawing is provided in this Declaration as Attachment A. Specific piezometer locations are provided on Figure 1 in Attachment A-1.

II. Cap Subgrade

a. Surcharge Program. The main purpose of the surcharge program in the Open Space Cap AOC was to remove settlement that would be detrimental to the remedy and permissible development. Surcharging was performed by placing fill materials to reach the surcharge design loads and then monitoring the areas to confirm that the objectives of the program had been met. The Surcharge Program was implemented moving from West to East. For planning and documentation purposes the Surcharge was split into 3 areas: Area 1S, Area 2S and Area 3S. Individual reports were submitted monthly during the course of the program. Surcharge Monitoring Plan Monthly Report No. 12, for the March 2015 reporting period, dated April 2015 indicated that surcharging in Areas 1S, 2S and 3S was complete. In addition, during the course of the surcharge program, DC 2015-3-4 was submitted concerning surcharge in the 0-12 foot-wide Deferred Area strip along Route 440. Mueser Rutledge Consulting Engineers (”MRCE”) prepared a letter dated September 29, 2015 stating that truncation of the easterly tip of the Surcharge pile in the deferred area by Route 440 would have no material impact on evaluation of achievement of the surcharge goals on SA-6 South. (Work adjacent to Route 440 had been deferred and will be completed in accordance with the Consent Order Consolidating the 100% Design for Study Area 6 North and Study Area 6 South filed into the Court on July 9, 2013.) The surcharge reports, which were peer reviewed by MRCE, concluded that the surcharge goal had been met for each area. MRCE letters acknowledging achievement of surcharge goals in Areas 1S, 2S, and 3S, as well as the September 29, 2015 letter, are included in Attachment C. The surcharge reports were also reviewed by O’Connell and Lawrence Inc. on behalf of the Plaintiffs. The Surcharge Completion Evaluation tables for each area are included in Attachment B.

b. Grading. Following surcharge, the cap was graded and compacted in accordance with the lines, grades and compaction requirements indicated in the Final 100% Design and Design Change DC 2015-02-24. Subgrade preparation was performed between May 11, 2015 and October 9, 2015. To document compliance with the grading requirements, a Construction Control Grid was established consistent with Specification 01460. The Construction Control Grid is included as Attachment D-1. Summary tables prepared by Maser Consulting PA (NJ licensed surveyor) comparing the design grades and actual grades at the Construction Control Grid nodes are included as Attachment D-2 confirming that all nodes are within tolerance. A topographic survey of the SA-6 South subgrade was prepared by Maser Consulting (Attachment E).

III. Cap Geosynthetics. Installation of the cap geosynthetics followed Maser Consulting's certification that the subgrade surface conformed to the specified Construction Control Grid. Amec Foster Wheeler provided QA approval of Maser's documented subgrade elevations prior to issuing to Langan Engineering and Environmental Services, Inc, ("Langan") for approval for geosynthetics deployment. In addition, as part of the subgrade approvals, Amec Foster Wheeler provided QA approval of the sand bentonite GCL to barrier wall connections (signed GCL to barrier wall logs are included in Appendix H of the Langan Cap Geosynthetic Quality Assurance (QA) Report for Study Area 6 South). The cap geosynthetics were placed between July 20, 2015 and November 4, 2015. The cap geosynthetics included components that were designed to meet the technical requirements of Section 65(a) of the Consent Decree. The cap geosynthetics scope included the following key tasks:

- Subgrade inspection for acceptability prior to geosynthetics deployment,
- Gas Vent/Geotextile and GCL installation over the subgrade and under the geomembrane,
- Geomembrane Installation-60 mil LLDPE,
- Geocomposite drainage/warning layer installation, and
- Warning tape installation.

Honeywell contracted with Langan to provide Independent QA for the SA-6 cap geosynthetics installation. As the Independent QA Engineer, Langan performed the QA activities specified in the Langan Cap Geosynthetic Quality Assurance (QA) Report for Study Area 6 South ("Langan Report"),

including monitoring, field oversight, and documentation. The report certifies that placement of the SA-6 South cap geosynthetics was completed in compliance with the construction design documents (see Attachment F).

Acceptance of the geosynthetic materials used for the SA-6 South Cap Construction was completed by Amec Foster Wheeler based on the results of the manufacturer's production quality testing (AGRU America, Inc. and their subcontracted companies). The Amec Foster Wheeler Engineer of Record provided a full-time site Geosynthetics Inspector to inspect materials deployment, installation and documentation for compliance with the Final 100% Design of the capping system. The Geosynthetics Inspector observed the placement of the GDL cover soil to verify that the soil was placed in accordance with the Earthwork and GDL specifications (02315 and 02374, respectively) and that the GDL was not damaged or unnecessarily stressed. The GDL cover soil will be included in a future Declaration. The Geosynthetics Inspector also observed the fabrication, installation and extrusion welding and vacuum testing of all boots.

QC for geosynthetics installation was provided by Entact and their specialty installer ESI. Entact also contracted with Geotechnics, Inc. to conduct the specified offsite laboratory testing required as part of the capping project, such as destructive seam testing. All ESI field QC and Geotechnics laboratory testing is incorporated into the Langan QA Report and are the subject of the Langan QA Certification. Langan offsite QA laboratory testing was completed by TRI Environmental, Inc. The Langan Report and the Langan engineer certification are included in Attachment F. As-built drawings of the cap geosynthetics (i.e, 60 mil Textured LLDPE Geomembrane, Gas vent Layer/Geosynthetic Clay Liner (GVL/GCL) Layout, Geocomposite Drainage Layer (GDL) Layout) are included as Attachment G.

IV. Hydraulic Barrier Wall Final Elevation. In Declaration #1, Honeywell declared the completion of hydraulic barrier installation at SA-6 South in accordance with the Final 100% Design and Related Design Changes. At the time of the Initial Declaration, the top of hydraulic barrier wall had been left at elevations consistent with the temporary flood control and subgrade/surcharge requirements.

The top of the hydraulic barrier wall was then trimmed to final elevation in preparation for cap placement. Hydraulic barrier wall cutting began June 9,

2015 and was completed on October 7, 2015. In Declaration #1, Honeywell indicated that "the final elevations will be included in a supplemental Declaration". The As-Built Drawings submitted as part of Declaration #1 have been updated to show the final top of wall of both the SCB wall and hydraulic sheet pile wall (Attachment H).

Items listed above will also be provided in the final Remedial Action Report.

1. Based on our professional experience, the data and information set forth in and attached to this Declaration, and our supervision of the SA-6 South construction activities, we believe that the Contingent Groundwater Collection Trench, Cap Subgrade, Cap Geosynthetics, and Hydraulic Barrier Wall Final Elevations were installed/completed in accordance with the SA-6 South Consent Decree and the Final 100% Design and Related Design Changes.

2. We certify that the foregoing is true and correct to the best of our respective knowledge.

Attention: Mr. Geoff Shallard

Re: Area 1S Surcharge Review
SA-6 South
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) October 27, 2014 review of Area 1S indicated settlement monitoring location S_FS-02 did not meet the defined surcharge program goal as of September 23, 2014. AMEC provided MRCE with updated settlement and piezometer monitoring data for Area 1S location S_FS-02 on April 14, 2015. The MRCE review of April 14, 2015 AMEC settlement and piezometer monitoring data for Area 1S location S_FS-02 is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated November 18, 2014 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressure. Post-surcharge total stress was calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken on November 25, 2014. Calculated post-surcharge effective stress for S_FS-02 is presented in Table 1. MRCE compared the calculated post-surcharge effective stress with the "Final Post-Development Conditions" effective stress estimate provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 1S monitoring locations have met the surcharge program goal as of November 25, 2014.

Very truly yours,

**MUESER RUTLEDGE CONSULTING ENGINEERS**

Attention: Mr. Geoff Shallard

Re: Area 2S Surcharge Review
SA-6 North
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of February 06, 2015 AMEC settlement and piezometer monitoring data for Area 2S is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated between January 12-29, 2015 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken at corresponding dates, between January 14-30, 2015. Calculated post-surcharge effective stresses are presented in Table 1. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 2S monitoring locations have met the surcharge program goal as of 01/30/2015.

Very truly yours,
**MUESER RUTLEDGE CONSULTING ENGINEERS**

Attention: Mr. Geoff Shallard

Re: Area 3S Surcharge Review
SA-6 South
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

The Mueser Rutledge Consulting Engineers (MRCE) review of March 30, 2015 AMEC settlement and piezometer monitoring data for Area 3S is summarized below:

AMEC indicated from borings and sampling the Vibrating Wire Piezometers (VWP) were set at the center of the compressible clay layer, which provides the most conservative pore water pressure reading for the effective stress evaluation. All the stress calculations are at the center of the compressible layers.

MRCE used latest measured elevation head dated between March 24-13, 2015 from "Vibrating Wire Piezometer – Data Report" to calculate the post-surcharge pore water pressures. Post-surcharge total stresses were calculated based on the fill thickness measurements from the "Settlement Platform – Data Report" taken on March 19, 2015. Calculated post-surcharge effective stresses are presented in Table 1. MRCE compared the calculated post-surcharge effective stresses with the "Final Post-Development Conditions" effective stress estimates provided by AMEC. The defined goal of surcharge program was to achieve an effective stress greater than the "Final Post-Development Conditions."

This review finds all Area 3S monitoring locations have met the surcharge program goal as of 03/30/2015.

Very truly yours,

AMEC Environmental & Infrastructure
511 Congress Street
Portland, ME 04101

Attn: Mr. Samuel G. Shallard
Re: DC 03-04-15
Area 3S Surcharge Pile Geometry on East End
Jersey City, NJ
MRCE File 11173

Dear Mr. Shallard:

This letter is in response to DC-03-04-15 "3S Surcharge Pile Geometry on East End," which requests change of the surcharge program at Area 3S to eliminate surcharge pre-load of a small area at the east end of the fill along the west side of Route 440.The April 24, 2015 MRCE letter summarized the settlement and piezometer monitoring data and confirmed that all monitoring locations in Area 3S satisfied the surcharge program goals. However, MRCE was not aware of the request of DC-03-04-15 at that review.

AMEC suggested that truncating the eastern tip of the wedge shaped surcharge fill will not significantly affect the goals of the Remedy/Surcharge program since the change in grade is from 0 – 5 ft. MRCE agrees with AMEC that since the increase in final grade is small, surcharging will have no significant affect. MRCE also reviewed available geotechnical data for the area in question, and finds that the compressible strata is pre-loaded such that no settlement will occur.

**Examining Pre-Consolidation Stress**

MRCE reviewed the soil profile closest to the "Deferred Area" and laboratory testing for compressible Stratum D. Boring location plan and summary of consolidation tests for Stratum D are attached (see Drawing B-1, Figure S-1, Plate 13 & Plate 18). The pre-consolidation stress (P'c) of the compressible layer Stratum D was tested for design of the Study Area 7 remediation. This test data was used to compute the pre-consolidation stress using two methods. The first method calculated the average P'c from the laboratory consolidation tests, resulting in P'c = 1930 psf. The second method calculated the effective overburden pressure at midpoint of Stratum D and multiplied it by the average OCR (overconsolidation ratio) defined by consolidation testing. With the average OCR = 2.23 and the average effective overburden stress = 1064 psf, the resulting average P'c = 2372 psf.

(see Appendix A). Settlement would only occur at the compressible layer if the effective stress due to filling exceeds 1930 to 2372 psf.

**Estimated Stress at Final Conditions**

Based on DC-03-04-15, the final grade will increase by 0 to 0.5 ft. The additional soil placed on top of the 12 ft wide area ranges from a height of 0 to 3 ft. Assuming an average height of the added soil as 1.5 ft and the maximum increase of grade, the final effective stress at the midpoint of Stratum D = 1314 psf, which is less than the lower bound of P'c = 1930 psf. (see Appendix A)

Since the effective vertical stress due to the final grade including planned added soil is less than the P'c of Stratum D, no settlement is expected. This technical review supports the AMEC evaluation that surcharging is not needed in the area addressed by DC-03-04-15.

Very truly yours,

**PROPERTIES OF PLASTICITY LIMIT SPECIMEN**

UNIFIED SOILS CLASSIFICATION - OL
LIQUID LIMIT, $w_L$ = 36
PLASTICITY LIMIT, $w_p$ = 22
PLASTICITY INDEX, $I_p$ = 14
NATURAL WATER CONT., $\%_w$ = 42.9
LIQUIDITY INDEX, $(w-w_p)/I_p$ = 1.5
SPECIFIC GRAVITY, $G_s$ = 2.61

**PROPERTIES OF CONSOLIDATION SPECIMEN**

ELEVATION OF SPECIMEN = -3.2
DEPTH OF SPECIMEN (FT) = 16.0
DIAMETER OF SPECIMEN (IN) = 2.5
INITIAL THICKNESS OF SPECIMEN (IN) = 1.0045
INITIAL WATER CONTENT, % = 38.9
FINAL WATER CONTENT, % = 27.1
INITIAL DEGREE OF SATURATION, % = 91.8
FINAL DEGREE OF SATURATION, % = 92.8

— — — — INITIAL VOID RATIO, $e_o$ = 1.107
- - - - - - - FINAL VOID RATIO, $e_f$ = 0.761
ESTIMATED PRECONSOLIDATION STRESS (TSF), $P_c$ = 0.53
EXISTING OVERBURDEN STRESS (TSF), $P_o$ = 0.347
COMPRESSION INDEX, $C_c$ = 0.292
SWELLING INDEX, $C_s$ =0.06 REBOUND FROM e = 0.486

# APPENDIX A

**MUESER RUTLEDGE CONSULTING ENGINEERS**

FILE 11173

MADE BY APS DATE 9/28/15

PROJECT CHROMIUM REMEDY SA-6

CHECKED BY ____ DATE ____

SUBJECT CALCULATION OF STRESSES

## APPENDIX A

① Using average Pc from consolidation tests:

Pc (SB-210D) = 0.53 tsf = 1060 psf

Pc (SB-211D) = 1.4 tsf = 2800 psf

Pc (average) = 1930 psf

② Using OCR from consolidation tests:

At ELEV. -2.5 ⇒ $\sigma'_v$ = 120pcf x 13.5 ft − 62.4pcf x 10 ft

= 1064 psf

OCR(SB-210D) = 1.77

OCR(SB-211D) = 2.69

OCR(average) = 2.23

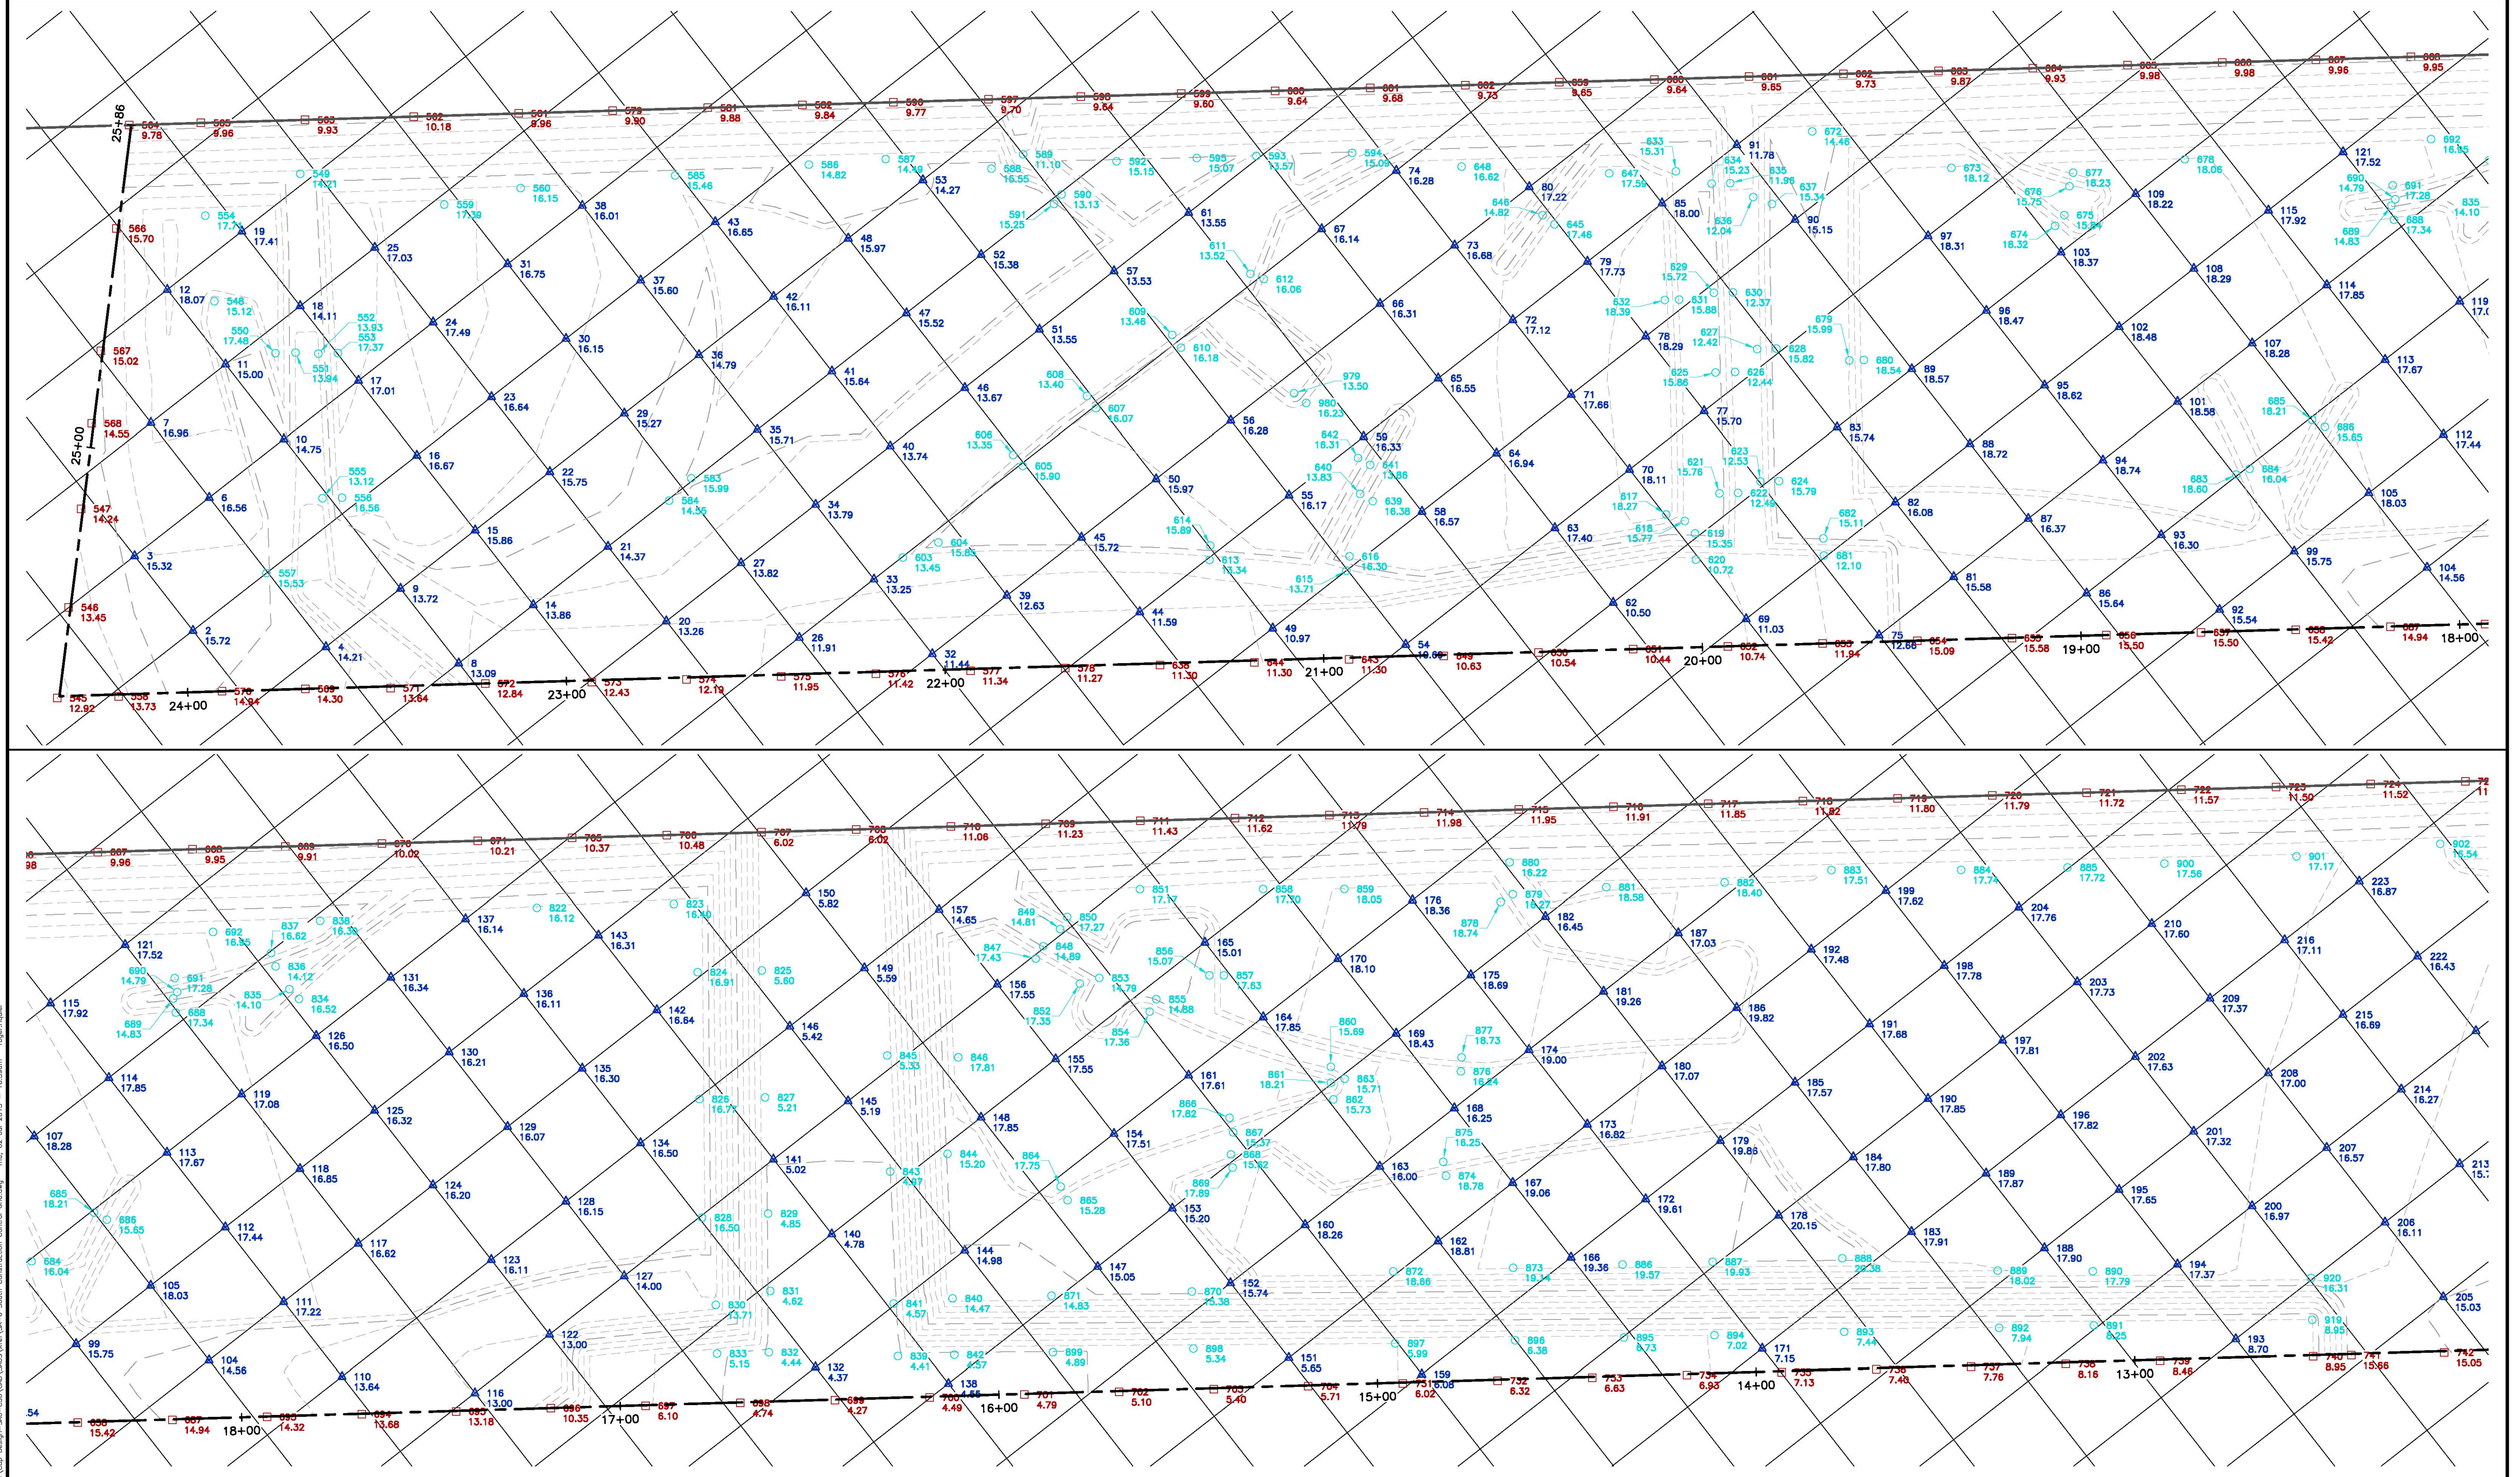
1064 psf x 2.23 = 2372 psf

AVERAGE ① & ② = 2151 psf

③ Stress at Final Condition

Final Effective overburden stress:

$\sigma'_{vf}$ = 1064 + (1.5+0.5) x 125pcf



= 1314 psf < 1930 psf

Added soil avg height = 1.5'

Max. increase in grade = 0.5'

1 This is the design elevation at Construction Control Grid Points.

2 Deviation = Surveyed Elevation - Design Elevation

| SA-6 South Cap Subgrade: Boundary Points (Table 3.5) | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Bottom Target Coordinates (based on TIN surface) | | | | | As-built Elevations | | | |
| Point # | Northing | Easting | Elevation 1 | Description | Date Obtained | Elevation | Deviation 2 | Comments |
| 2039 | 684165.48 | 603190.60 | 6.1 | BNDY | 10/7/2015 | 6.2 | 0.1 | Point surveyed within Tolerance |
| 2305 | 684268.00 | 603302.11 | 8.1 | BNDY | 10/7/2015 | 8.2 | 0.1 | Point surveyed within Tolerance |

1 This is the design elevation at Construction Control Grid Points.

2 Deviation = Surveyed Elevation - Design Elevation

3 Points in 0.1 - 0.5 ft. tolerance are due to a slight overcut in the top of slopes where it wouldn't be suitable for backfill due to compaction difficulties.

**Per SPECIFICATION 01460 SURVEY. SECTION 1.05 F. Spot Elevations - Survey shall be constructed to provide an accuracy of 0.1 feet vertically. Ninety percent of all spot elevations placed on the maps shall have an accuracy of at least 0.1', and the remaining 10 percent shall not be in error by more than one-half (1/2) the contour interval (0.5'). Break points added to replace Grid Points that fell on slopes and Boundary Points will be treated as Spot Elevations as defined in Section 1.05 F.**

**Maser Consulting P.A. certifies that the elevations, with their corresponding date obtained, of the Grid Points depicted in Table 1, Break Points in Table 2, Boundary Points in Table 3, and topographic spot elevations are correct, and representative of the as-built cap subgrade throughout the SA6 South cap.**

## GENERAL NOTES

1. *THE SOLE PURPOSE OF THIS PLAN IS TO SHOW AS-BUILT GEOMEMBRANE GRADING ELEVATIONS WITHIN THE SA6 SOUTH CAP AREA AT THE PROJECT SITE.*
2. *AS-BUILT GEOMEMBRANE GRADING LOCATIONS AND ELEVATIONS WERE OBTAINED BY MASER CONSULTING P.A. ON MULTIPLE FIELD VISITS FROM 7/2/15 THROUGH 10/7/15. GEOMEMBRANE GRADING SURFACES AND CONTOURS WERE GENERATED BY ENTACT, CHECKED BY AMEC AND CONFIRMED BY MASER CONSULTING P.A.*
3. *HORIZONTAL DATUM NAD 1983, VERTICAL DATUM NGVD29.*

## LIST OF ACRONYMS

AO – Add-On
AOC – Area of Concern
BO – Burnout
CF – Custom Fit Repairs
CQA – Construction Quality Assurance
DCB – Design Change Bulletin
DO – Damage By Others
DS – Destruct Sample (Fusion)
DSX – Destruct Sample (Extrusion)
EOR – Engineer of Record
FS – Failed Seam
GCL – Geosynthetic Clay Liner
GDL – Geocomposite Drainage Layer
GVL – Geocomposite Venting Layer
HB – Hydraulic Barrier
IFC – Issued for Construction
LF – Linear Feet
LLDPE – Linear Low-Density Polyethylene
PB – Pipe Boot
PSI – Pounds per Square Inch
RCRA – Resource Conservation & Recovery Act
RFI – Request for Information
RAR – Remedial Action Report
RIR – Receiving Inspection Report
RP - Repair
RW – Roller Wrinkle
SA-6 – Study Area 6
SCB – Soil Cement Bentonite
SI – Subgrade Irregularity
SJ – Seam Joint
QA - Quality Assurance
QA Report – Cap Geosynthetic Quality Assurance Report
QC – Quality Control
WR - Wrinkle

## 1.0 INTRODUCTION

The purpose of this Cap Geosynthetic Quality Assurance Report (QA Report) is to present the observations made, and data collected during the construction of an engineered cap placed within the Study Area 6 (SA-6) South Open Space Area of Concern (AOC) located in Jersey City, New Jersey (Site). The capping activities at SA-6 South included the preparation of the soil subgrade, placement of geocomposite venting layer (GVL), geosynthetic clay liner (GCL), linear low-density polyethylene (LLDPE) geomembrane, and a geocomposite drainage layer (GDL). Langan Engineering & Environmental Services, Inc. (Langan) was contracted by Honeywell International, Inc. (Honeywell) to provide independent Quality Assurance (QA) for the installation of the geosynthetic components of the cap.

The Chromium Remedy *100% Design* Issued for Construction dated June 2013, (*100% Design*) was prepared by AMEC Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler) on behalf of Honeywell, to address chromium contamination at SA-6 South. The *100% Design* required installation of a Resource Conservation and Recovery Act (RCRA) – equivalent geosynthetic cap system, including a venting layer for naturally occurring methane, covering approximately eight acres of the designated Open Space AOC. As part of this QA Report, the Record Drawings, which outline the placement and construction of the various geosynthetic components of the cap, have been provided as *Appendix A*. Other design details discussed herein, including the Issued for Construction (IFC) drawings, geosynthetics specifications, and geosynthetic products approved for this site are incorporated by reference only. Refer to Amec Foster Wheeler documents titled "*100% Design*," dated June 2013, and "*Remedial Action Report (RAR) for Chromium*" for these details.

This QA Report documents the results of the QA Geosynthetic activities conducted during the construction of the cap at SA-6 South by both Langan and Amec Foster Wheeler field personnel. Refer to the Construction Quality Assurance (CQA) Plan prepared by Langan in June 2015 (attached as *Appendix B*) for a description of the scope conducted by Langan, as well as the roles and responsibilities of the owner, Engineer of Record (EOR), earthwork contractor, and liner contractor. Design Change Bulletins (DCBs) and Requests for Information (RFIs) which were generated subsequent to the *100% Design*, and relevant to the QA scope were reviewed and approved by the EOR, and are further summarized in the EOR Closure Report.

This QA Report specifically includes the following documentation of the cap construction activities:

- The Record Drawings;
- Summary of the various phases of the work observed as part of this QA Report;
- Daily Reports indicating the work activities completed each day and other pertinent information;
- Daily cap construction forms submitted by the Geosynthetic Installer which includes: Repair Reports, Trial Weld Logs, Panel Placement Forms, Seam Control Forms, Destructive & Non-Destructive Test Forms, and Subgrade Approval Forms;
- Field testing results for fusion welds and extrusion welds;
- Laboratory testing results for the destructive samples collected (i.e., fusion & extrusion welds);

- Photographs depicting daily work activities and the various phases of the capping activities; and
- Independent QA's certification that the placement of the SA-6 South geosynthetics was implemented in general compliance with the design documents.

This QA Report addresses the cap construction of SA-6 South only. The cap construction at SA-6 North is proposed to commence in the spring of 2016 and will be addressed in a separate QA Report (to be provided upon completion of the SA-6 North cap).

## 2.0 SA-6 SOUTH CAP CONSTRUCTION AND DOCUMENTATION

### 2.1 General

This Section describes the construction methods used and the Quality Control (QC) and QA documentation completed as part of the construction of SA-6 South. This Section also provides the results of the QC and QA testing that was performed during field activities by Langan (QA Engineer), Environmental Specialties International (ESI) as the Geosynthetic Installer, and Entact, LLC (Entact) as the Construction Contractor and QC.

QA activities commenced on July 7, 2015, with Langan conducting observation of the soil subgrade preparation for the western end of SA-6 South (near the Hackensack River). Geocomposite / geotextile placement began on July 20, 2015 and continued until capping activities were completed by November 4, 2015. Relevant observations and QA/QC testing during this timeframe are defined further in this section. A project Certificate of Completion (completed and verified by Entact) certifying that the SA-6 South cap has been constructed and completed in compliance with the project drawings and technical specifications is attached as *Appendix C*.

### 2.2 Survey Control / Subgrade Elevations

Entact subcontracted Maser Consulting, P.A. (Maser), a licensed New Jersey land surveyor, who provided surveying services during the construction of the cap. Maser completed surveying of the cap from the initial subgrade preparation phases to the placement of the geomembrane. Maser surveyed the subgrade elevations of the cap prior to material placement and tabulated the survey results as compared to the design elevations on the construction control grid. These survey activities included:

1. Measurement of elevations of the subgrade surface in accordance with a pre-determined Construction Control Grid. Conformance to the design lines and grades was verified by Amec Foster Wheeler and Entact by comparing the actual elevations with the design elevations on the Construction Control Grid. The accepted subgrade elevations, and corresponding Construction Control Grid for SA-6 South are provided within *Appendix D1* and *Appendix D2*, respectively.
2. Measurement of the as-built conditions including the perimeter or termination of the geomembrane and geotextile over the hydraulic barrier (HB), and Soil Cement Bentonite

(SCB) wall, as well as, the location of the geomembrane repairs, boots / penetrations, and other pertinent information related to the construction of the cap.

3. The subgrade surface was observed to verify uniformity of grade between the construction control grid points.

This survey information is shown on the final Record Drawings attached in *Appendix A.* Amec Foster Wheeler provided QA review and verification of the Maser survey data.

## 2.3 Soil Subgrade Preparation

Soil subgrade preparation was required prior to the placement of the geotextile and the geomembrane in the areas to be capped. Soil subgrade preparation for the cap was completed by Entact using the following procedures:

- Step 1: Entact conducted rough grading of the subgrade surfaces with the use of track-mounted dozers to prepare the appropriate grades and to clear the surface of large objects (i.e. rocks, metals, debris, etc.);
- Step 2: The subgrade surface was fine-graded and compacted in accordance with the project specifications presented in the *100% Design* package. Subgrade sections not meeting survey or compaction requirements were re-worked by Entact until specified conditions were achieved. At the conclusion of this step, Entact provided a certification that the surface met the grading and compaction requirements. The certifications included the Construction Control Grid tabulation prepared by Maser (as defined in *Section 2.2*) and issuance of a Certificate of Subgrade Surface Acceptance as defined in further detail below;
- Step 3: When precipitation was forecast, the prepared subgrade surface was temporarily covered with a polyethylene plastic sheet to protect the soil from overnight precipitation; and
- Step 4: The subgrade surface would be uncovered in approximate 100 ft. sections (moving from west to east across SA-6), followed by extra fine grading conducted by laborers who cleared the surface of extraneous materials greater than ½-inch in diameter, followed by repair and re-compaction of any areas that became inadvertently wetted.

Entact and ESI also conducted their own observation of the subgrade surface to confirm if the surface was acceptable for the placement of the geosynthetic material. Upon notification by Entact that the grading was acceptable, Langan conducted an independent observation to identify that the subgrade was prepared in general accordance with the *100% Design*.

If the soil subgrade surface was deemed acceptable with no additional re-work required, the Langan QA and Entact QC representative signed and submitted an acceptance form for the approved subgrade. The daily QA subgrade approval forms are provided in *Appendix E*, with the ESI Certificate of Subgrade Surface Acceptance forms provided in *Appendix E1*, and the Langan Certificate of Soil Surface provided in *Appendix E2.* In the event the subgrade surface was not

deemed acceptable, Steps 2, 3, and 4 outlined above were repeated until an acceptable subgrade surface was achieved (based on conditions outlined in the Langan Certificate of Soil Surface forms) and confirmed by Langan and Entact.

*Figure 1* below shows a typical section of subgrade approved for geomembrane placement. Additional photos and summaries of the subgrade preparation activities conducted each day are presented in the Daily Reports and Daily Photo Logs provided in *Appendix F.*

**Figure 1 – Typical Soil Subgrade Approved for Geomembrane Placement**

## 2.4 SA-6 South Cap Components

### *2.4.1 Geotextiles*

After approval of various sections of the subgrade surface, a 16 oz. geotextile layer was placed over the HB and SCB barrier walls around the perimeter of the capped area. According to the *100% Design* package, this geotextile layer was designed to protect the 60-mil LLDPE geomembrane from potential puncture damage from the perimeter barriers / walls. The approved 16 oz. non-woven geotextile fabric layer (i.e., defined as SKAPS GE-116 in Amec Foster Wheeler's *EOR Closure Report*) was delivered to the project site, offloaded, and staged onsite by Entact. For each delivery, Amec Foster Wheeler prepared a Receiving Inspection Report (RIR) to document receipt of acceptable materials. The RIRs outlining the date, material, quantity, and other pertinent details of the geotextile rolls delivered to the Site are provided in *Appendix G*.

The 16 oz. geotextile was installed by ESI at locations shown on the Record Drawings. Geotextile was placed along the boundaries of SA-6 South over the HB and SCB wall located along the western, northern, southern, and eastern boundaries of the cap. The 15 ft. wide geotextile panels were placed with approximately 13 ft. inbound of the perimeter of the HB and SCB walls, along with 2 ft. of geotextile extending outbound of the perimeter containment walls.

Geotextile panels were overlapped at least 12-inches and seamed using a dual hot wedge welder that melted the two surfaces together to form a bond (also referred to as leistering). The 16 oz. geotextile was placed along the boundary areas of SA-6 at locations above the Site water table (i.e. locations where geosynthetic clay liner was not required). The geotextile (on the interior of the Cap) overlapped the geocomposite venting layer and was leistered in place following the procedure outlined above. *Figure 2* below shows the 16 oz. geotextile being placed over the HB wall (southern end of SA-6 South cap), and *Figure 3* shows the geotextile overlapping the GVL Note, the GVL roll was placed in a general north to south direction across SA-6, while the 16 oz. geotextile roll was placed in a general east to west direction.

**Figure 2 – 16 oz. Geotextile Placed Over HB Wall (southern end of SA-6 South)**

**Figure 3 – 16 oz. Geotextile / GVL Over SCB Wall (northern end of SA-6 South)**

### *2.4.2 Geocomposite Venting Layer (GVL)*

Prior to placement of the 60-mil LLDPE geomembrane, GVL was placed over the soil subgrade at locations above the water table to serve as a venting layer for naturally occurring methane that may emanate from below the cap.

The approved GVL (i.e., defined as SKAPS TN-220-2-6 in *EOR Closure Report*) consisted of an extruded polyethylene drainage net structure (or geonet) sandwiched between two non-woven geotextile layers. The GVL was delivered to the Site, offloaded, and staged onsite by Entact. The RIRs for the GVL delivered to the Site are provided in *Appendix G*.

The GVL was placed by ESI, over the approved soil subgrade for areas above the Site water table at locations shown on the Record Drawings (*Appendix A1*).

The GVL rolls were typically oriented in a north to south direction. The leading edge of the GVL panels was held in place by sand bags until the subsequent panels could be placed and seamed. The placement strategy for this material was to limit the amount of GVL to be placed in a day, to an area that could also be covered by the LLDPE geomembrane that day. This strategy was used to minimize the risk of the GVL and underlying subgrade from becoming wet during overnight rain events. GVL panels were not placed during precipitation events, in the presence of excessive moisture, or during high winds.

GVL panels were placed according to Section 02380 – Gas Venting System as defined in *100% Design* package. GVL was generally placed with the predominant flow direction towards the edge of the cap with the GVL running parallel to any slopes or elevation changes (i.e. running up/down the slope and not across the slope). For adjacent GVL panels, the following minimum seaming requirements were met:

- Adjacent rolls of GVL were placed so that the geonet overlapped by 2 to 3-inches, and the geotextiles overlapped by at least 4-inches;
- The bottom layer of geotextile (underneath the geonet) was overlapped to ensure that no areas of the soil subgrade were exposed;
- White plastic fasteners were placed at a maximum of every 5 ft. along the seam to connect adjacent pieces of GVL. Additional fasteners were requested by the QA team when the seams extended down slopes or at significant subgrade elevation changes. *Figure 4* below shows placement of the white plastic fasteners; and
- Once the geonet was tied with a sufficient number of fasteners, the top geotextile of the GVL was continuously sewn as shown in *Figure 5* below.

**Figure 4 – Typical Placement of GVL & Joining of the Net with Plastic Fasteners**

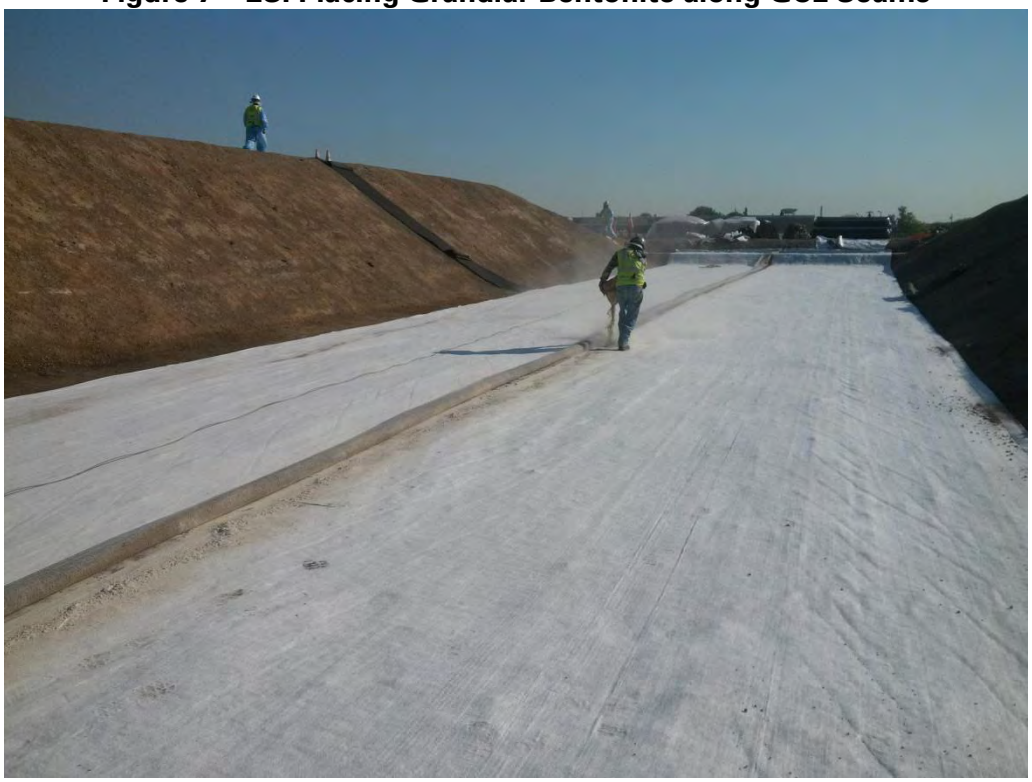
**Figure 5 – Typical Sewing of GVL (for top layer of geotextile)**

During placement of the GVL, butt seams, rips, tears, or other damaged areas of the GVL were repaired by exposing an appropriate area of geonet, placing fasteners as defined in the project specifications, and covering the area with a new piece of geotextile which was leistered in-place. Additional details of the GVL placement are further described in the Langan Daily Reports and Photo Logs provided in *Appendix F*.

### *2.4.3 Geosynthetic Clay Liner (GCL)*

The approved GCL consisted of granular sodium bentonite clay sandwiched between, supported, and encapsulated by two geotextiles, and held together by needled punching. The approved GCL (i.e., Cetco Bentomat DN) was delivered to the Site, offloaded, and staged onsite by Entact. The RIRs for the GCL rolls delivered to the Site are provided within *Appendix G*.

The approved GCL was deployed by ESI in accordance with Section 02375 – Geosynthetic Clay Liner as defined in the *100% Design* package. GCL was placed directly over the approved soil subgrade, at locations situated below (to 1 ft. above) the Site water table. These areas generally consisted of: the bottom of utility corridors, the bottom of drainage swales and Site elevation changes, and the eastern end of SA-6 South (where the subgrade is depressed to allow the surface grading to tie in with Route 440). These locations are shown on the Record Drawings.



For areas where the edges of the GCL terminated on a slope, staples were used to secure the GCL in place as shown below in *Figure 6*. The staples were placed along the top 6-inches of the GCL edge and were placed through the GCL and secured into the underlying soil subgrade. The GVL overlapped the edge of the GCL a minimum of 12-inches and was then leistered to the GCL. When staples were used, the GVL was placed over the staples (at least of 1 ft. of overlap), to mitigate the potential of the staples coming in contact with the geomembrane.

**Figure 6 – ESI Securing GCL with Staples**

During placement of the GCL, granular bentonite was placed along the GCL seams as outlined in the project specifications and shown on *Figure 7* below. No GCL was placed during precipitation, in the presence of excessive moisture, or during high winds.

**Figure 7 – ESI Placing Granular Bentonite along GCL Seams**

Additional details on the placement of the GCL are further described in the Langan Daily Reports and supporting photo logs provided in *Appendix F*.

#### *2.4.3.1 Bentonite Sand Plug*

As outlined in specification Section 02375 – Geosynthetic Clay Liner of the *100% Design* package, a sand bentonite plug was constructed on the inboard side of the HB wall for the low-lying areas (below the Site groundwater table) along the edges of SA-6 South. This bentonite sand plug was constructed in the field by Entact by mixing clean sand with sodium montmorillonite at a 90% sand to 10% bentonite ratio.

The plug was constructed to a depth of approximately 18-inches below the HB wall elevation, and was approximately 2 ft. thick. Additional details on the edge connection details are provided below in *Section 2.4.3.2*. *Figure 8* below also shows the typical construction of the bentonite sand plug along the HB wall.

**Figure 8 – Typical Construction of Bentonite Sand Plug along HB Wall**

#### *2.4.3.2 GCL to Barrier Wall Connection Details*

GCL to Barrier Wall Logs are provided within *Appendix H*. As per the approved Langan CQA Plan, Amec Foster Wheeler completed a GCL to Barrier Wall (HB Wall & SCB) Connection Detail form for the low-lying areas of SA-6 South (below the Site water table). This form documented that the bentonite sand plug was appropriately constructed, that the barrier wall was clean and exposed, and that the appropriate GCL overlap (1 ft. minimum) was maintained.

### 2.4.4 60-mil Low Linear Density Polyethylene (LLDPE) Geomembrane

A textured LLDPE geomembrane manufactured to a nominal 60-mil thickness was placed over the GVL and GCL layers at the Site to mitigate groundwater infiltration through the cap. The rolls of the approved 60-mil LLDPE geomembrane were delivered to the Site, offloaded, and staged onsite by Entact. The RIRs for the LLDPE geomembrane are provided in *Appendix G*.

The 60-mil LLDPE geomembrane was placed directly over the GVL and GCL geotextiles. The 60-mil geomembrane was placed in accordance with specification Section 02372 – Cap Geomembrane Liner as defined in the *100% Design* Package. The location and placement of the LLDPE panels is documented on the ESI Panel Placement Logs provided in *Appendix I*.

ESI deployed the geomembrane rolls in a general north to south orientation. Hand clamps were used on the edge of the panels to aid in the final positioning, as required. The leading edge of the LLDPE geomembrane panels were held in place by sand bags until the subsequent panels

could be placed and seamed via fusion welding methodology. The number of panels deployed in a single day was limited to the amount that could be field seamed that day. No panels were placed during precipitation, in the presence of excessive moisture, or during high winds. The minimum temperature for seaming was specified as 32°F, with a maximum temperature of 104°F. No cold or hot weather seaming was conducted as temperatures did not reach below 32°F, or above 104°F during geomembrane installation.

Each individual LLDPE panel was observed for damage by ESI, Entact, and Langan during the installation process. Prior to seaming, the approved geomembrane was observed by Langan to ensure that the material was free of defects or damage prior to seaming. Areas observed to be damaged / defective, or areas where the geomembrane had to be custom cut to conform to the subgrade contours, were marked for repair. Repairs were completed in the field by ESI via patching and welding the geomembrane as further described below. All repairs were documented and recorded on the Record Drawings (*Appendix A2*). Additional details on the repair methodology and types of repairs are further described in *Section 2.4.4.4*.

The LLDPE geomembrane was seamed in the field by two welding methods: extrusion and double-fusion. Extrusion welding was used for repairs, short seams, and areas where the double fusion could not operate. Extrusion welding was performed with a hand held extrusion welding gun. The double-fusion seaming (fusion welding) was performed using a self-propelled "wedge welder" which formed an air channel between the two seams. Fusion welding was performed with a minimum of 4-inches overlap as per the project specifications.

The integrity of the welds was monitored by both destructive and non-destructive test methods. The destructive testing consisted of collecting samples from the completed seams at a minimum frequency of one sample per 500 ft. of weld (for both fusion and extrusion welds). A representative of Langan was onsite to confirm the locations of the destructive samples along with a representative of ESI.

The destructive samples were analyzed by Geotechnics, Inc. (Geotechnics) the Contractor's Material Quality Control Laboratory. Langan also collected additional QA samples (approximate 15% of total samples collected) and submitted samples to TRI Environmental, Inc. (TRI) for independent QA testing. Destructive sample locations were repaired in the field and tested with a vacuum box. All destructive sample locations have been recorded and are shown on the Record Drawings (*Appendix A2*). The laboratory results of the destruct samples are discussed further in *Section 2.4.4.3* below.

In addition to the destructive testing, non-destructive testing was completed by ESI during cap construction. Two types of non-destructive tests were used at the Site: air channel tests (pressure tests) and vacuum box tests as defined further below:

1. Pressure Testing - The pressure tests were conducted on 100% of all the double fusion welded seams where both ends of the seam were clamped and sealed and a pressure needle was inserted into the air channel. The air channel was then pressurized to thirty pounds per square inch (psi) and the pressure was maintained for a minimum of five minutes. If the pressure did not stabilize, or a pressure drop greater than four psi was noted over a five minute span, then the seam was deemed unacceptable and the faulty

area was isolated and repaired. Results of the non-destructive testing are discussed further in *Section 2.4.4.2* below.

2. Vacuum Box Testing - For patch / repair work and other areas where extrusion welding was required, the extrusion welds were vacuum box tested by ESI. A soapy solution was applied to the weld area, and a vacuum box was placed over the weld for a minimum of ten seconds and observed for the appearance of soap bubbles. Any areas where these bubbles appeared were marked, repaired, and retested. Any areas that failed the vacuum box test were identified as a non-compliance issue and are discussed further in *Section 2.4.6* below.

At seams or locations where vacuum box or pressure testing could not be conducted (i.e. boot penetrations), the extrusion welds were visually inspected by observing the welding process and checking the weld for uniformity and completeness. Individual forms were generated to document the installation of each boot / penetration. Additional details on the pipes / penetrations encountered on the cap are further described in *Section 2.4.4.5*.

For additional details on the geomembrane placement, destructive and non-destructive testing, patch / repair work, and other geomembrane related construction activities, refer to the Langan Daily Reports and Photo Logs provided in *Appendix F*.

#### *2.4.4.1 Trial Weld Logs*

Prior to any seaming of the geomembrane each day, the fusion and/or extrusion welding equipment was used to conduct trial welds (or test strips) to confirm that the material and equipment met the specification requirements. Test strips were collected (using the same 60 mil LLDPE geomembrane placed across the cap) by completing a sample fusion or extrusion weld. This activity included producing several types of seams to qualify that a specific seamer and apparatus would yield the desired specified performance requirements. These seam types included: smooth-to-smooth, smooth-to-textured, and textured-to-textured. It should be noted that the 60 mil geomembrane installed across the cap was textured (60-mil Microspike); however, the manufacturer's product has a smooth edge for welding.

The trial welds were cut and tested on a portable tensiometer by ESI. Langan and Entact observed the trial weld tests to confirm that the minimum peel and shear values were obtained (as per specification Section 02372 – Cap Geomembrane Liner defined in the *100% Design* package). These trial welds were completed prior to commencement of seaming at the start of each day, and once every four hours. The results of daily trial weld logs are provided in *Appendix J*.

#### *2.4.4.2 Non-Destructive Testing Results*

Non-Destructive Pressure Testing was conducted along the geomembrane panels, and the repaired / patched areas (i.e., using vacuum box testing) by ESI, as per the project specifications. The results of the non-destructive testing for each of the panel seams were provided in the Seam Control Logs shown in *Appendix K*. Additionally, the associated repairs

and the corresponding vacuum box testing results are presented in the ESI Repair Report attached in *Appendix L*.

During the construction of the cap at SA-6 South, there were two non-destructive tests (one pressure test and one vacuum box test) that failed during the field testing which consisted of the following:

1. Failed non-destructive (pressure) test for geomembrane panel seams Panel #7 / Panel #8 and identified as Repair (RP)-13 (as shown on the Record Drawings); and
2. Failed non-destructive test (vacuum box test) for repair RP-215 (Panel #50).

Both of these failures were subsequently repaired by ESI in general accordance with specification Section 02372 – Cap Geomembrane Liner and were documented as non-compliance issues which are further described in *Section 2.4.6* below.

#### *2.4.4.3 Destructive Testing Results*

Destructive testing was conducted for the fusion and extrusion welding that was completed along the edge of the geomembrane panels. Destruct samples were collected at a minimum sampling interval of 500 linear feet (LF) of seaming length for the initial twenty-five (25) samples. The locations of the destruct samples were identified in the field by the Independent QA Monitor (Langan) and are shown on the Record Drawings (*Appendix A2*). Once the destruct sample locations were determined, ESI cut and tested the destruct samples (as per the project specifications).

Six 1-inch wide specimens were cut from the destruct sample for field testing. These samples were then tested by a tensiometer equipped with a drive/pull apparatus rate of 20-inches per minute. Three of the specimens were tested for peel strength, and the remaining three for shear strength. The samples were tested to confirm that the geomembrane met the specified peel and shear strength values outlined in *Table 1* below. Additional details on the test results are provided on the Destructive Sample Information Logs attached as *Appendix M.*

**Table 1 – LLDPE Geomembrane Seam Property Requirements**

| Property | Test Method | 60-mil LLDPE Value |
|---|---|---|
| Shear Strength (min. avg.) | ASTM D 6392 | 90 lb/in |
| Peel Strength – Extrusion (min. avg.) | ASTM D 6392 | 66 lb/in |
| Peel Strength – Fusion (min. avg.) | ASTM D 6392 | 75 lb/in |

In addition to the field testing completed by ESI, a total of twenty-nine (29) fusion weld destruct samples, and fifteen (15) extrusion weld samples were sent to Geotechnics for lab verification.

A total of twenty-nine (29) fusion weld destruct samples (DS-1 through DS-29) were collected during the capping of SA-6. For the first 25 QA samples collected, all samples met the specified destructive testing requirements outlined in *Table 1*. As per the specification, the frequency of fusion weld destruct sampling was reduced from every 500 LF of welded seam to every 1,500 LF of welded seam. A summary of the peel and shear QA testing conducted for the 29 fusion weld samples collected is summarized in *Appendix N*.

A total of fifteen (15) extrusion destruct samples were collected throughout the capping of SA-6 South. *Table 2* below summarizes the results of the extrusion weld destruct samples collected as well as the corresponding laboratory data, peel and shear averages, and compliance with specification Section 02372 – Cap Geomembrane Liner outlined in the *100% Design* package.

As highlighted above on *Table 2*, one destruct sample DSX-13 failed to meet the peel strength criteria for one of the five specimens tested. While the average of the five specimens tested for this specimen did comply with the project specifications, the extrusion weld in this area was designated as non-compliant. As such, the weld was subsequently patched, repaired, and re-tested and documented as Repair RP-487 in *Appendix L*. An additional extrusion weld destruct sample was collected and labeled as DSX-15. Additional details on this non-compliance issue are described in further detail in *Section 2.4.6*.

In addition, Langan collected a total of six QA samples (4 fusion weld samples and 2 extrusion weld samples) to verify the results of the Geosynthetic Installer's laboratory data. Langan's QA

samples were submitted to Texas Research Institute Environmental, Inc. (TRI). The results of the ESI and Langan destruct samples indicated that the peel and shear strength values met the requirements outlined in the project specifications. Furthermore, the additional QA samples collected by Langan yielded values that were in close proximity to the values obtained by ESI (which were generally lower than the values obtained by Langan's QA laboratory). The Laboratory Destruct Test Results are provided in *Appendix N*.

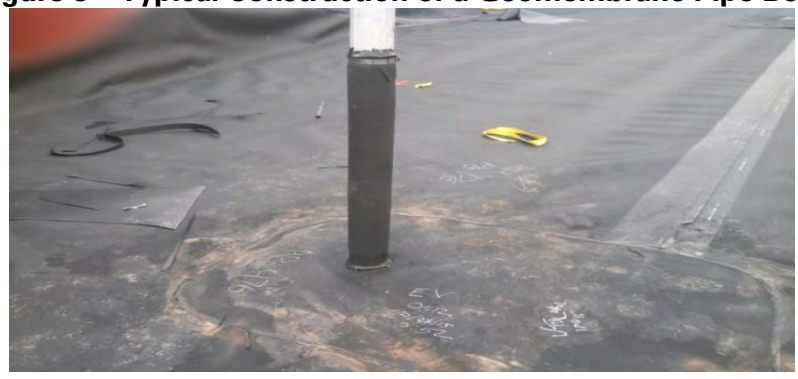
#### *2.4.4.4 Repair Reports*

The ESI Repair Report is provided in *Appendix L*. Several different types of repairs were observed and recorded during field activities by ESI. These corresponding repairs are shown on the Record Drawings (*Appendix A2*), and consisted of the following types:

- Custom Fit Repairs (CF) – Custom Fit Repairs consisted of areas of the geomembrane cap where the geomembrane was cut (and subsequently repaired) to allow the geomembrane to conform to the cap contours. These areas were typically located where there were abrupt elevation changes, such as drainage and utility swales, utility corridors, and planting areas;
- Wrinkles (WR) – Wrinkles consisted of areas where excess geomembrane was observed. Where the size of the wrinkle was determined to be detrimental to the geomembrane (i.e. wrinkles with the potential for folding), the wrinkle was cut, and the excess geomembrane was overlapped and sealed with an extrusion weld in accordance with the project specifications;
- Roller Wrinkles (RW) & Burnouts (BO) – Roller wrinkles can occur when slight differences in length between the two geomembrane edges being welded resulted in formation of a wrinkle along the geomembrane seam. Wedge burnouts occurred where the wedge became jammed thus causing the welder to burn / melt through the geomembrane seam. These areas were subsequently patched and repaired according to the project specifications;
- Destruct Samples (DS) – These areas consisted of the geomembrane destruct samples that were cut for laboratory testing. The removal of the sample creates a hole in the seam, thus these areas were subsequently patched according to the project specifications;
- Pipe Boots (PB) – Pipe boots were installed where penetrations of the geomembrane occurred such as at wells, piezometers, gas vents, and access manholes. Additional details are provided in *Section 2.4.4.5;*
- Add On (AO) – AO areas consisted of sections of SA-6 where an additional piece of geomembrane was required to finish a geomembrane run across the cap (from north to south);
- Seam Joints (SJ) – Seam joints consisted of the areas where non-destructive testing (pressure testing) was conducted along a "T" section of the geomembrane;
- Subgrade Irregularities (SI) – Subgrade Irregularities consisted of areas along the geomembrane cap where a rock or object larger than ½-inch in diameter was encountered underneath the geomembrane after the material had been placed. These

areas were subsequently cut, the rock/debris removed, and the area patched / repaired according to the project specifications. These SIs were identified as non-compliance issues and are discussed in further detail in *Section 2.4.6* below;

- Damage By Others (DO) – DO consisted of damage / punctures to the geomembrane cap caused by equipment or personnel during grading of the protective cover soil. These DO instances were identified as non-compliance issues and are discussed in further detail in *Section 2.4.6* below.
- Failed Seam (FS) – Failed seams consisted of fusion / extrusion weld samples that were collected, and failed to meet the strength criteria of the material as outlined in Section 02372 – Cap Geomembrane Liner presented in the *100% Design* Package (and summarized in *Table 1*). These FS instances were identified as non-compliance issues and are further described in *Section 2.4.6* below.



For additional details on the geomembrane repairs and non-compliance issues observed during field activities refer to the *Appendices L and P,* respectively.

#### *2.4.4.5 Geomembrane Penetrations & Pipe Boot Installation*

The geomembrane penetration and pipe boot logs are provided in *Appendix O*. The pipe boots were field fabricated by ESI, and the boots were installed at monitoring wells, gas vents, piezometers, and access manhole penetrations across the cap.

The geomembrane boots consisted of a vertical (minimum of 2 ft.) section of LLDPE being wrapped around the penetration (i.e. well, gas vent, etc.) from the base to the top of the penetration. The geomebrane wrap was then heat sealed and an extrusion weld was placed with a vertical seam connecting the two pieces of geomembrane. The end of the boot terminated in a skirt section which was placed over the boot. The skirt and the geomembrane overlapped a minimum of 18-inches and the skirt was welded to the geomembrane. A neoprene rubber gasket was used between the boot and the penetration and secured with a 1-inch wide stainless steel clamp (or two ½-inch clamps). An LLDPE sacrificial sheet was then placed between the boot and the clamp for protection and a butyl sealant was applied along the top of the boot. *Figure 9* below shows the typical construction of a geomembrane pipe boot in the field by ESI. The welding of each boot was observed by Langan, and each boot fabrication was documented on an individual boot fabrication form provided in *Appendix O*. The four typical types of penetrations present on the SA-6 South cap are defined below.

**Figure 9 – Typical Construction of a Geomembrane Pipe Boot**

*2.4.4.5.1 Monitoring Wells*

A total of four (4) monitoring wells were located within the SA-6 South cap. The monitoring wells were constructed with PVC and were encased in a 4-inch metal casing. Refer to *Appendix O* for the penetration and boot logs for monitoring wells: 073-MW-1BR, 115-E1A-SO, 115-W3-SO, and 115-W5-SO.

*2.4.4.5.2 Gas Vents*

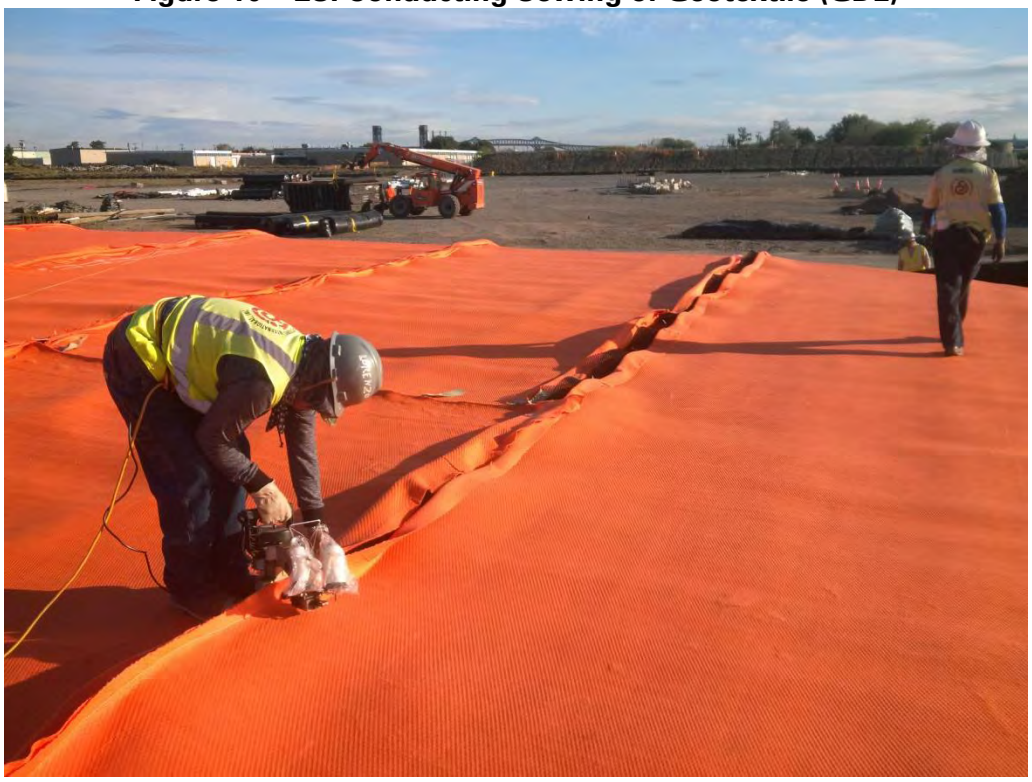
A total of eight (8) gas vents were constructed through the cap. Gas vents were completed in accordance with Section 02380 – Gas Venting System of the *100% Design* Package to allow any naturally occurring methane to vent to the atmosphere. Refer to *Appendix O* for the penetration and boot logs for gas vents GV-0 through GV-7, with the corresponding locations shown on the Record Drawings (*Appendix A2*).

*2.4.4.5.3 Piezometers*

A total of five (5) piezometers were installed through the cap to allow the project team to compare the groundwater within capped area to the groundwater immediately outside of the cap. Piezometers were encased within a 4-inch steel casing. Refer to *Appendix O* for the penetration and boots logs for piezometers PZ-12, PZ-14, PZ-16, PZ-18, and PZ-20, and to the Record Drawings (*Appendix A2*) for the corresponding piezometer locations.

*2.4.4.5.4 Pump Station and Access Manholes*

A total of one pump station and three (3) access manholes were completed with field fabricated geomembrane boots. Refer to *Appendix O* for the penetration and boot logs for Access Manhole #1, Access Manhole #2, Access Manhole #3, and Access Manhole #4, with the corresponding locations shown on the Record Drawings (*Appendix A2).*



### 2.4.5 Geocomposite Drainage Layer (GDL)

To facilitate drainage and transport of infiltrated surface water off the cap, a geocomposite drainage layer (GDL) consisting of a geonet with a non-woven geotextile bonded to both sides (i.e., defined as SKAPS TN 330-2-6 ) was delivered to the Site, offloaded, and staged onsite by Entact in accordance with the project specifications. The RIRs for the delivered GDL rolls are provided in *Appendix G*. The GDL was placed at the Site by ESI and was placed directly over the geomembrane cap as shown on the Record Drawings (*Appendix A3*).

GDL panels were placed according to the specification Section 02374 – Geocomposite Drainage Layer as defined in the *100% Design* package. For adjacent GDL panels, the following minimum seaming requirements were met:

- Adjacent rolls of GDL were overlapped so that the geonet overlapped by 2 to 3-inches, and the geotextiles overlapped by at least 4-inches;
- The bottom layer of geotextile (underneath the geonet) was overlapped so that no areas of the underlying geomembrane were exposed;
- White plastic fasteners were placed at a maximum of every 5 ft. along the seam. Additional fasteners were requested by the QA team when the seams extended down the slopes or elevation changes were noted; and
- Once the geonet was tied with a sufficient number of fasteners, the top geotextile of the GDL was continuously sewn as shown in *Figure 10* below.

**Figure 10 – ESI Conducting Sewing of Geotextile (GDL)**

During placement of the GDL, butt seams, rips, tears, or other damaged areas of the GDL were repaired by exposing an appropriate area of geonet, placing fasteners as defined in the project specifications, and covering the area with a new piece of orange geotextile (same as the GDL geotextile) which was heat sealed in place.

Once the GDL was placed, Entact placed protective cover soil (i.e., 1 ft. layer of material) directly over the GDL. In addition, yellow caution tape was placed every 55-inches over the GDL prior to protective cover soil placement. The caution type had bold type which indicated "Danger Do Not Dig – Peligro No Excavar" in English and Spanish. Additional details on the GDL placement are provided in the Langan Daily Reports and Photo Logs provided in *Appendix F*.

### 2.4.6 Non-Compliance Issues

The Summary of Non-Compliance & Corrective Action Sheets are provided in *Appendix P*. During the SA-6 capping activities, any QA field tests, observations, or failed samples that did not comply with the project specifications were documented and recorded as a non-compliance issue. A total of twelve (12) non-compliance issues were identified throughout the capping of SA-6 South and are summarized below:

1. Subgrade Irregularities – Refer to Sheet Numbers 1, 2, 4, 6, and 8 of the Non-Compliance & Corrective Action Sheets (*Appendix P*). In general, the subgrade irregularities consisted of stones or other material greater than ½-inch in size that was encountered below the geomembrane cap after the material had been placed and

secured. These objects were removed by cutting the geomembrane, removing the object, and patching the geomembrane in accordance with the project specifications. The subgrade showed no indication of these items at the time of subgrade approval, and it is postulated that these items were dislodged from the subgrade as the GVL was drawn across the subgrade surface;

2. Subgrade Irregularity (Hydrated GCL) – Refer to Sheet Numbers 7, 9, and 10 (*Appendix P*). In general, the Hydrated GCL Subgrade Irregularities consisted of areas where the underlying GCL layer had become saturated following heavy rain events. The saturation of the GCL was due to the unfinished grading of the SA-6 cap, as well as equipment failures, which resulted in water ponding along the edges of the cap during high intensity rain events. This ponding caused the water to move laterally across limited portions of the cap thus wetting the GCL layer prior to cover soil placement. For these areas, the geomembrane was cut to expose the GCL followed by replacement of the wetted GCL. Visual observation of the underlying subgrade soils exhibited no damage or washout of the subgrade. Repair activities were conducted so that the resulting materials were placed in accordance with the project specifications;
3. Failed Vacuum Box Test – Refer to Sheet Number 5 (*Appendix P*). During vacuum box testing of repair RP-215, a failed extrusion weld was identified. As such, a new geomembrane patch (RP-222) was placed over the failed extrusion weld, and subsequently tested using the vacuum box to verify the integrity of the new weld;
4. Failed Non-Destruct Test – Refer to Sheet Number 3 (*Appendix P*). A failed non-destruct test (pressure test) was encountered along Panel Seams #7/8. Based on the length of the failed seam (approximately 6 ft. along the southern end of SA-6), the entire seam was patched and repaired (approximate 2 ft. by 6 ft. patch). Vacuum box testing was then conducted to confirm the integrity of the new extrusion welds;
5. Failed Destruct Sample – Refer to Sheet Number 11 (*Appendix P*). Extrusion weld destruct sample DSX-13, which was collected from repair RP-477, failed one of the five test specimens for peel strength testing (Note: averages of the five specimens conformed to the project specifications). A new patch was placed over RP-477, and was identified as a Failed Seam (FS). It should be noted that the new patch was identified as repair RP-486. Once completed, an additional extrusion weld destruct sample (DSX-15) was collected to confirm the new patch met the specification requirements. Subsequent laboratory testing confirmed that the DSX-15 destruct sample complied with the project specification strength requirements; and
6. Geomembrane Puncture (Equipment) – Refer to Sheet Number 12 (*Appendix P*). During final grading of the protective cover soil by Entact, an excavator bucket punctured the geomembrane liner along the northern end of SA-6 South (along the SCB Wall). This puncture was subsequently repaired / patched, welded, and vacuum box tested by ESI, according to the project specifications. The repair associated with the puncture was identified as repair RP-488, and was listed as Damage by Others (DO).

Additional details on the non-compliance issues encountered, as well as the subsequent repair activities, are further described in the Langan Daily Reports and Photo Logs provided in *Appendix F*.

# 3.0 DECLARATIONS

## 3.1 General

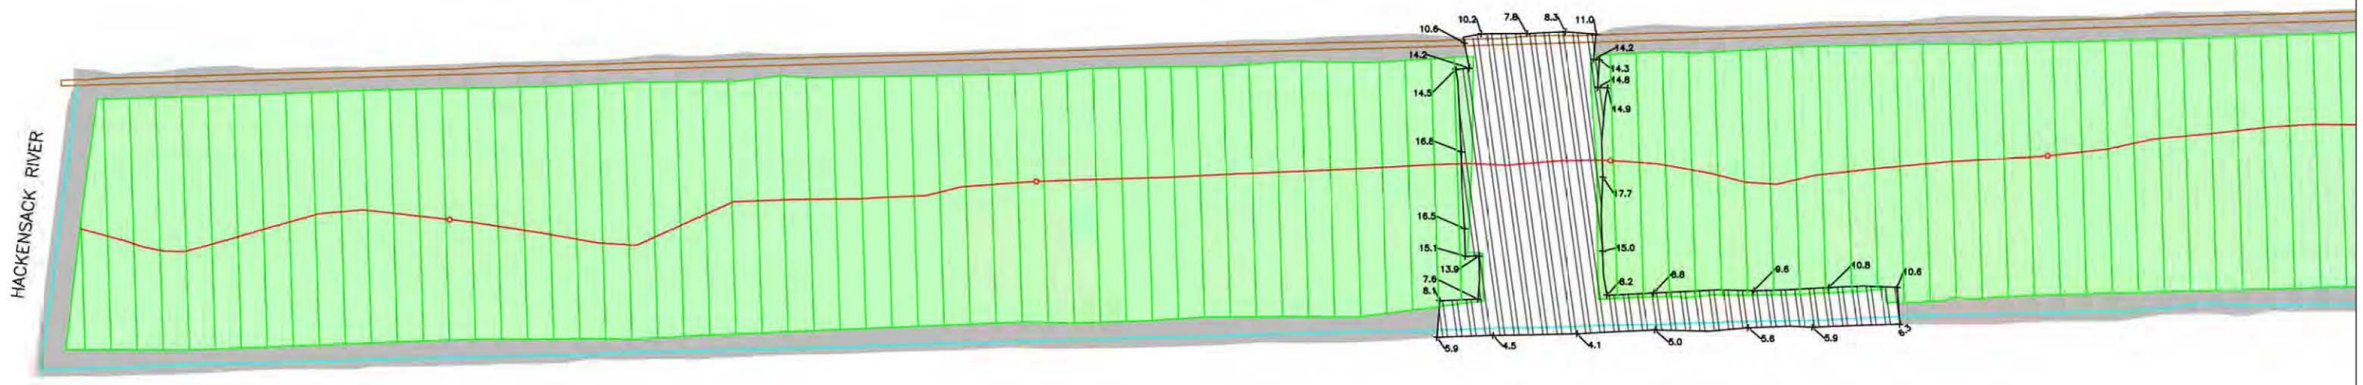
Langan personnel have monitored the construction and field activities completed for the capping of SA-6 South specific to the subgrade preparation and placement of the geotextile and geocomposite materials as defined herein. Based on the field observations made by Langan along with the field and laboratory test data collected by the Contractor and Subcontractors, it is our professional opinion that the construction observed at SA-6 South complied with the approved *100% Design* package. Additional details on the work and approval of materials is outlined in the *EOR Closure Report*.

## 3.2 Limitations

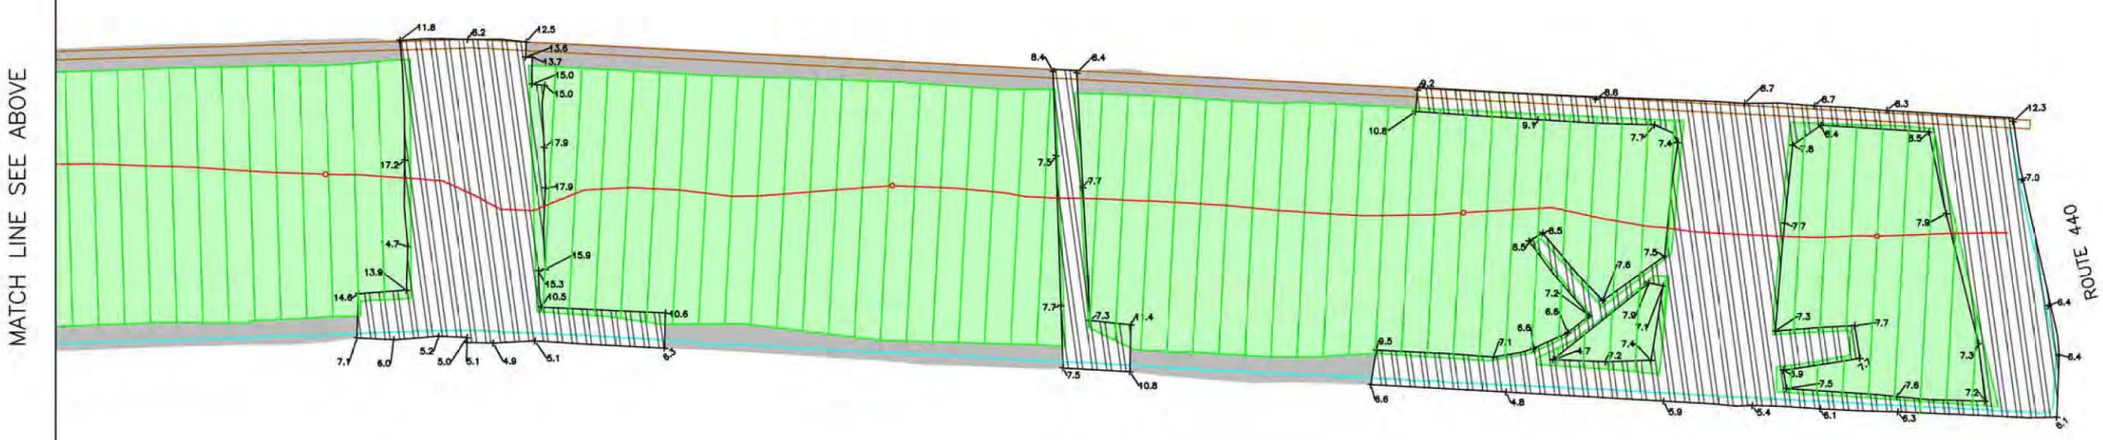
This Cap Geosynthetic Quality Assurance Report (QA Report) was prepared by Langan (in conjunction with Amec Foster Wheeler) for the exclusive use of Honeywell. This QA Report applies specifically to the subgrade preparation and construction of the geosynthetics components of the SA-6 South cap only.

The construction observations and monitoring were conducted under the conditions stated. Conclusions made in this report were based on these observations and data obtained from field and laboratory tests conducted on the QA samples collected.

The topographic survey measurements were completed by Entact and their licensed surveyor Maser and subject to review and approval by Amec Foster Wheeler. Langan did not independently verify the accuracy of this data.



Acceptance of the geosynthetic materials used for the SA-6 South cap construction was completed by Amec Foster Wheeler. Furthermore, the QC laboratory testing was completed by Geotechnics (under the direction of Entact) and QA laboratory testing was completed by TRI (under the direction of Langan).



The approval of all materials used for this project was completed by Amec Foster Wheeler in the *EOR Closure Report*. The geosynthetic production quality testing was completed by AGRU America, Inc. and their subcontracted companies working on their behalf. Langan did not independently verify the accuracy of the conformance test data.

## 1.0 INTRODUCTION

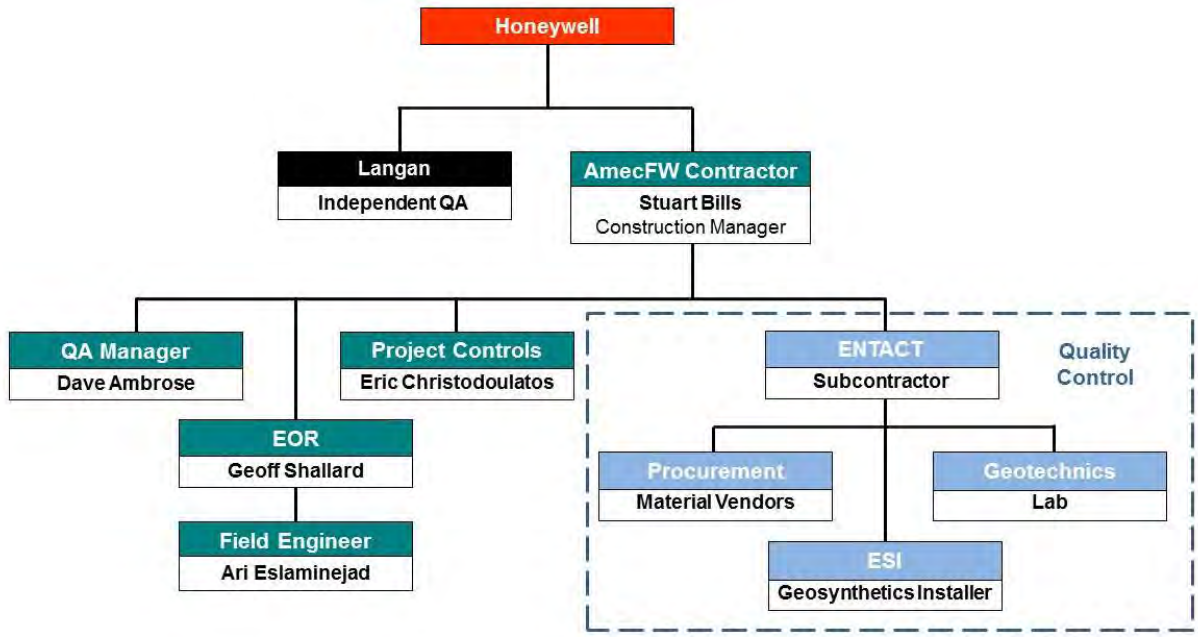
Honeywell International Inc. (Honeywell) is currently remediating Study Area 6 (SA-6), located in Jersey City, New Jersey (Site). SA-6 encompasses work in two areas: SA-6 North and SA-6 South, which are separated by Study Area 7 (SA-7). The Open Space areas at SA-6 North and SA-6 South will be covered with an engineered cap that includes a linear low-density polyethylene (LLDPE) geomembrane cover, a gas venting layer, a geocomposite drainage layer (GDL), a geosynthetic clay liner (GCL), and other related geosynthetic cap components. Technical specifications and design drawings for the engineered cap may be found in the document titled "100% Specification and Design Drawings."

Honeywell retained Langan Engineering and Environmental Services, Inc. (Langan) as the Independent Quality Assurance (QA) Engineer for the cap geosynthetics installation. This Construction Quality Assurance (CQA) Plan has been prepared in support of this site remediation project with pertinent supporting details outlined herein.

### 1.1 Purpose

The purpose of this CQA Plan is to describe the quality assurance and control procedures required for the construction of the geosynthetic components of the capping system for the Study Area 6 site, encompassing SA-6 North and SA-6 South.

The ultimate goal of this CQA program is to ensure that proper construction techniques and procedures are implemented throughout the course of this phase of the SA-6 project in accordance with the project specifications. Upon completion of the construction activities, a Cap Geosynthetics QA Report will be prepared.



All of the involved parties will receive a copy of this CQA Plan including the Owner, Construction Contractor, Capping System Subcontractor, Geosynthetic Installer, and the Independent Quality Assurance Engineer. The roles and responsibilities of these parties are outlined further in Section 2.0.

## 2.0 PERSONNEL RESPONSBILITIES, AUTHORITY, AND QUALIFICATIONS

### 2.1 General

The principal parties involved in the permitting, design, and construction of the final capping system for the SA-6 site include the Owner, Design Engineer, Construction Contractor, and the Independent Quality Assurance Engineer. Additional entities include the Geosynthetic Installer and Material Quality Control Laboratory. The project organization chart is shown on Figure 1. Descriptions of the individual parties are provided in the sections below.

**Figure 1 – SA-6 Liner Installation Organization Chart**

### 2.2 Owner

Honeywell, as Owner, is ultimately responsible for the construction of the capping of SA-6. The Owner has retained the Design Engineer, Construction Contractor, and the Independent Quality Assurance Engineer.

### 2.3 Design Engineer

Amec Foster Wheeler Environment & Infrastructure, Inc. (AmecFW), as the Design Engineer, was responsible for preparing the final design of the capping system, as well as plans and specifications for the construction work. The final design includes relevant aspects of the capping system, including details of the subgrade preparation, gas venting system, utility trenches, geosynthetic placement details, soil cover requirements, and other relevant design considerations. Samuel G. Shallard is the Engineer of Record (EOR) for AmecFW.

Technical specifications and design can be found in the document titled "100% Specifications and Design Drawings."

Personnel involved with the design engineering portions of the project are outlined herein:

- **Engineer-of-Record**
  Mr. Samuel Shallard shall serve as the Engineer of Record (EOR) and technical lead. Mr. Shallard will also be the lead engineer in resolving technical questions that arise during project execution.

- **Quality Assurance Manager**
  Mr. David Ambrose shall serve as the Quality Assurance (QA) Manager. He shall be directly responsible for subcontractor conformance to the technical specifications and project requirements.

- **Field Engineering**
  Ms. Ari Eslaminejad will serve as the EOR site representative.

### 2.4 Construction Contractor

AmecFW shall also serve as Construction Contractor (Contractor), and is responsible for constructing the soil capping system in accordance with the design criteria, plans, and specifications while using the necessary construction procedures and techniques. The Contractor has engaged ENTACT (Subcontractor) to support AmecFW with these activities.

A New Jersey licensed land surveyor will be contracted to conduct the licensed surveying tasks required in the contract documents and in this CQA Plan as well as to prepare the required record documents.

The Contractor shall provide sufficient project management and project supervision staff to ensure the submission and approval of materials, and that the execution of the work is completed in a timely manner and in accordance with the plans and specifications. Work shall be completed to the standards defined by this CQA plan and the plans and specifications. The Construction Manager, or a designated representative, shall be present during construction activities to oversee work by contractor personnel and/or subcontractor personnel. The Construction Manager or designated representative will coordinate activities directly with the Owner's representative and representatives of the Independent Quality Assurance (QA) Engineer. The Contractor shall be responsible for the repair or replacement of any items or work found defective. The Construction Manager will be supported by the AmecFW Quality Assurance Manager.

For the SA-6 capping project, AmecFW has provided a list of the capping construction team including subcontractors and corresponding responsibilities. A summary of these team members is provided below and presented on the organization chart shown on Figure 1.

- **Construction Manager**
  Mr. Stuart Bills shall serve as the AmecFW Construction Manager and Site Health & Safety Officer with the responsibility for the day-to-day Site activities. He shall report directly to the Honeywell Manager of Construction and the Honeywell Remediation Manager. Mr. Bills shall be responsible for the project implementation schedule, budget, and subcontractor oversight.

- **Project Controls**
  Mr. Eric Christodoulatos shall be responsible for coordinating and tracking submittal approvals and Request for Information (RFI) responses with the EOR. He will also be responsible for project financial cost and schedule tracking and projections.

- **Capping System Subcontractor – ENTACT**
  ENTACT is contracted to AmecFW to perform the cap construction. ENTACT will be responsible for installing the SA-6 capping system in accordance with "100% Specifications and Design Drawings." ENTACT will also be responsible for coordinating scheduling, project deviations, work plans, and any other pertinent construction details directly with the project team. ENTACT will report directly to AmecFW, and will provide the final construction details, including as-built drawings, upon project completion.

- **Geosynthetic Installer – ESI**
  ESI (Installer) is subcontracted to ENTACT. ESI will be responsible for installing the SA-6 geosynthetic materials in accordance with the project plans and specifications, and will work directly with ENTACT. ESI will also be responsible for coordinating scheduling, project deviations, work plans, and any other pertinent construction details directly with the project team.

- **Material Quality Control Laboratory – Geotechnics**
  Geotechnics is subcontracted to ENTACT. Geotechnics will be responsible for supplying laboratory testing results required as part of the capping project, such as destructive seam testing.

### 2.5 Cap Geosynthetics Quality Assurance Engineer

Langan has been retained by Honeywell to provide Independent Quality Assurance for the SA-6 Cap Geosynthetics installation. The Quality Assurance (QA) Engineer will perform the activities specified in this CQA Plan (i.e. monitoring, field oversight, and documentation) and provide a Cap Geoynthetics QA report at the conclusion of the project for the work observed. At a minimum, the Independent QA engineering staff will include a Geosynthetic QA Manager, QA Engineer, and on-site Field Technician, as outlined herein.

**Geosynthetic QA Manager – Mr. Jeffrey Stoicescu, P.E.**

**Duties:**

- Review design criteria, plans, and specifications for clarity and completeness so that the CQA Plan can be implemented.
- Advise the Lead Quality Assurance Engineer and On-Site Field Technician on CQA requirements and procedures. For similar projects, the project manager will support the EOR and field team members on a variety of Requests for Information and Submittals that will vary either the construction sequence or materials.
- Schedule and coordinate CQA inspection activities.
- Routinely update the Owner and Design Engineer on cap geosynthetic status throughout the duration of the geosynthetic portion of the project.
- Attend conference calls as required to provide potential solutions to requests when requested by the EOR.

**Authority:**

The Geosynthetic QA manager has the authority to determine whether or not materials, procedures, and/or installed materials meet the minimum project requirements, and to reject any materials, procedures, and/or installed work that fails to meet the project requirements. The project manager will advise the EOR, Contractor, and Owner of the rejection of materials, procedures, or installed work.

**Lead Quality Assurance Engineer – Mr. Dan Bosworth**

**Duties:**

- Direct and support the CQA personnel in performing observations and material tests;
- Confirm that the testing data is accurately recorded and maintained;
- Verify that the raw data is properly recorded, validated, reduced, summarized, and interpreted;
- Review and interpretation of data sheets and reports;
- Notify the Geosynthetic QA Manager of potential conflicts with the design drawings;
- Coordinate with the EOR to reject defective work and verify that corrective measures are implemented;
- Identify work that should be accepted, rejected, or uncovered for observation, or that may require special testing, inspection or approval.

**Authority:**

The Lead QA Engineer shall have the authority to observe and test any material and/or work, and render a decision as to whether the work is acceptable (based on the testing), and ensure that any work that does fail is removed and replaced with acceptable materials and/or workmanship.

**On-site Field Technician – Mr. Dan Bosworth and/or Mr. Connor Shields**

**Duties:**

- Perform site monitoring of the work in progress to assess compliance with the design criteria, plans, and specifications;
- Observe deliveries received on site as required on the Receiving Inspection Report provided as Appendix A2;
- Verify that the tests are conducted according to this CQA Plan;
- Report to the Lead QA Engineer results of inspections, including work that is not of acceptable quality or that fails to meet the specified design; and
- Complete inspection and testing forms as necessary.

**Authority:**

The on-site technician will have the authority to observe and test material and render a decision of whether the work is acceptable based on observation of testing and help ensure that work that does not conform to the approved plans and specifications is removed and replaced with acceptable materials and/or workmanship.

## 3.0 QUALITY CONTROL MEETINGS

### 3.1 Daily Tailgate Safety Meeting

A daily tailgate meeting will be held prior to commencement of any work activities for the day at approximately 6 A.M or time designated by the Construction Manager. The Contractor, Subcontractor, Geosynthetic Installer, and on-site quality assurance personnel involved in the field work procedures for that specific day shall be present at this meeting. The Daily Meeting shall include relevant aspects of the work for the day and its potential relationship to relevant health and safety (H&S) aspects outlined in their respective H&S plans. Individuals who arrive after the tailgate meeting has been conducted shall convene with the Construction Manager or other designate for the H&S briefing prior to starting work.

### 3.2 QA/QC Coordination Meeting

A QA/QC coordination meeting will be held prior to the construction of the capping system. Representatives of Honeywell, the EOR, the Construction Contractor, and the Independent QA Engineer will be present. The agenda for this meeting may include, but not be limited to:

- Familiarize each involved party with the CQA Plan and its role relative to the design criteria, site construction and closure plans, specifications, and construction documentation;
- Review the responsibilities of each involved party;
- Review the Contractor's projected work schedule and methodology;
- Determine any changes, if necessary, to the CQA Plan that are needed to ensure that the capping system will be constructed to meet the specific design;
- Review lines of authority and communication for each organization;
- Discuss the established procedures or protocol for observations and tests including sampling strategies;
- Discuss the established procedures or protocol for handling design change bulletins, construction deficiencies, repairs, and retesting;
- Review methods for documenting and reporting inspection data;
- Review methods for distributing and storing documents and reports;
- Review work area security and safety protocol;
- Review procedures for the location and protection of construction materials and for the prevention of damage to the materials from inclement weather or other adverse events;
- Conduct a site walk-around to review construction materials where available and to inspect equipment storage locations; and
- Minutes of the preconstruction meeting will be prepared by the Quality Assurance On-site field technician and will be distributed to all parties.

### 3.3 Progress Meeting

Progress meetings will be held once a week on Tuesdays at 8:30 A.M or at an alternate time designated by the Construction Manager. These meetings shall be scheduled between the primary parties involved with this project. At a minimum, a Representative of Honeywell, the Contractor's Construction Manager, the EOR, and a representative of the Independent QA team shall be present. At times, a subcontractor may be requested to attend as well.

### 3.4 Geosynthetic Pre-Installation Meeting

A progress meeting will be held prior to commencing installation of the geomembrane and/or geosynthetic materials. At a minimum the attendees shall be the Contractor's Construction Manager, the Lead Quality Assurance Engineer and On-Site Field Technician, as well as representatives from ENTACT and ESI. The agenda for this meeting will include but is not limited to the following:

- Discussion of CQA procedures and requirements;
- Review Panel Layouts;
- Review of Repair tracking methods and drawings;
- Discussion of procedures or protocol for observations and tests including sampling strategies;
- Installation sequence and methods;
- Projected work schedule; and
- Minutes of the geosynthetic pre-installation meeting will be prepared by the Project Controls representative and will be distributed to all parties.

### 3.5 Observation and Testing Records

There will be observation and testing records that will be utilized in conjunction with the construction oversight performed by the Quality Assurance (QA) Field Technician. The observation logs listed below contain the data to be recorded by the Quality Control Representative and can be found in Appendix A. The QA on-site field Technician will complete the following observation and testing records:

- Geomembrane Observation Records – The geomembrane inspection records forms consisting of:
    - Material delivery checklist (see Appendix A4)
    - Subgrade surface acceptance records (see Appendix A5)
    - Trial weld logs (see Appendix A6)
    - Panel placement record (see Appendices A7)
    - Panel seaming log (see Appendix A8)
    - Non-destructive testing log (see Appendix A9)
    - Repair log (see Appendix A10)
    - Conformance Test Chain of Custody Form (A11)
    - Destructive testing log (see Appendices A12 and A13)
    - Penetration Sealing Observation / Cap to Barrier Installation Observation (see Appendix A14)
    - Daily inspection report for the geomembrane liner (see Appendix A15)
- Other related forms including certification of completion (see Appendix A1), receiving inspection report table (see Appendix A2), and notice of non-compliance and corrective action form (see Appendix A16).

The QA on-site field technician overseeing geomembrane installation will independently document related data contained within the records listed above to provide the information to review the Contractor's geomembrane capping system subcontractor documentation prior to acceptance of the installed geomembrane cap. The Contractor shall provide access to the work

site and shall provide the QA on-site field technician access to all field data and records, as built drawings, and shall collect duplicate samples as required for testing by the QA on-site field technician laboratory subcontractor as required.

In addition, the on-site field technician will maintain a field notebook onsite to document observations, test results, weather conditions, work defects, etc. that occur during observation of construction activities.

## 4.0 CONSTRUCTION QUALITY ASSURANCE

### 4.1 General

The final capping system consists of the following layers, from bottom to top:

- A gas venting system (geocomposite drainage layer and vents);
- A 60-mil geomembrane LLDPE layer;
- A geocomposite drainage layer with warning layer;
- 12-inch thick geocomposite drainage layer cover soil;
- 16 oz woven geotextile root barrier; and
- Soil layers consisting of structural fills, planting soils, and capped with a 6-inch minimum topsoil layer.

The layers of the capping system are described in the sections below.

### 4.2 Subgrade Preparation

The subgrade layer of the capping system is shown on construction drawing C-301, provided in "100% Specifications and Design Drawings." The soil surface for the capping system (subgrade) is currently under construction to prepare the surface in accordance with the subgrade specification. These subgrade surface conditions will require review and approval by the Independent QA Engineer and Capping System Contractor and geosynthetics installer prior to placement of the geosynthetic materials as defined below.

#### 4.2.1 Quality Assurance

The subgrade observation and approval QA/QC forms have been provided in Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance to Section 02372 found in "100% Specifications and Design Drawings" and note deviations from the technical specifications;
- Observe subgrade preparation; and
- Review documentation to verify compliance.

Testing and installation documentation referenced above that is developed by the Subcontractor will be submitted to the QA Engineer for review. Copies of this documentation will be included as

part of the Cap Geosynthetics QA Report prepared by the Independent QA Engineer. The Cap Geosynthetics QA Report for the subgrade preparation shall, at a minimum, include the following:

- Documentation of qualifications of all contractors and CQA personnel.
- Daily reports prepared by the QA Engineer;
- Subgrade acceptance certificates for each area to be covered by the cap system, signed by the Geosynthetics Installer, the Subcontractor, and QA Engineer;
- Daily construction progress reports clearly showing subgrade preparation; and
- Quality control documentation, as detailed in this CQA Plan.

### 4.3 Gas Venting System

The gas vent layer shall be comprised of a layer of geocomposite drainage material and a gooseneck-shaped vent to facilitate communication between soil gas under the cap and the atmosphere. This gas venting system is shown on drawings C-121 and C-301 in "100% Specifications and Design Drawings."

Section 02374 from "100% Specifications and Design Drawings" is summarized on Table 1 and indicates the requirements for the geocomposite gas venting layer. Requirements include, but are not limited to:

- Packaging, shipment, and storage of material;
- Handling and placement requirements;
- Seaming procedures; and
- Material repairs.

The specification requirements for the goose-neck shaped vent, which have been provided in Section 02380 in "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Gas vent pipe materials; and
- Installation of the pipes via pipe laying, jointing, and pipe cutting.

#### 4.3.1.1 Quality Assurance

The GDL and gas vent QA/QC forms have been provided as Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Sections 02372 and 02380, provided in "100% Specifications and Design Drawings," and note deviations from technical specifications;
- Observe subgrade preparation;
- Overlapping of geocomposite and connection procedures;
- Material repairs;
- Observe pipe materials handling and storage;
- Observe installation of gas vent system; and
- Review of QC Documents to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Contractor will be submitted to the QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the QA Engineer. The Cap Geosynthetics QA Report for the geocomposite layer shall, at a minimum, include the following:

- Documentation of qualifications of all installers and CQA personnel;
- Daily reports prepared by the QA Engineer; and
- Daily construction progress reports clearly showing geocomposite and piping materials placed by date.

### 4.4 Geomembrane Layer

The geomembrane selected for use in the cover system is a 60-mil (0.060 inch) thick LLDPE. A microspike double-sided textured geomembrane has been approved for use on this project. Work shall consist of installing the LLDPE geomembrane and the overlying geocomposite in the areas as shown on the construction drawing C-301 provided in "100% Specifications and Design Drawings."

The specification requirements for the geomembrane layer, which have been provided in Section 02372 of "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Packaging, shipment, and storage of material;
- Handling and placement requirements;
- Non-destructive and destructive seam testing procedures; and
- Material repairs.

#### 4.4.1 Quality Assurance

Prior to the start of capping activities the geosynthetic installer shall provide the Design and Independent QA Engineers with a panel layout drawing.

The Subcontractor's installer shall furnish the certified test results for all geomembrane to be used to the EOR, or EOR representative, for review as part of the required shop submittals prior to shipment to the site. The EOR, or EOR representative, will review the test results for conformance with the criteria included in the contract specifications.

The geomembrane layer QA/QC forms have been provided as Appendix A. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Section 02372 provided in "100% Specifications and Design Drawings" and note deviations from technical specifications;
- Review subgrade preparation and approval to place geomembrane materials;
- Observe effect of weather conditions on geomembrane installation;
- Seam preparation;
- Seaming equipment and procedures;
- Overlapping and temporary bonding;
- Test seams;
- Non-destructive and destructive seam testing;

- Penetration sealing observations for gas vents, piezometers, and groundwater collection system manhole to the LLDPE.
    - Note cap to barrier exterior detail will be observed and documented by AmecFW field engineering representative.
- Repair procedures and testing ;
    - Defective areas may include:
        - Large holes, tears, cold bends, cracks, etc.:
        - Other localized flaws;
        - Small to large tears and large lengths of failed seams;
        - Areas of inadequate seams; and
- Documentation to demonstrate compliance.

Testing and installation documentation referenced above that is developed by the Capping System Subcontractor will be submitted to the QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the Independent QA Engineer. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The Cap Geosynthetics QA Report for the geomembrane layer shall, at a minimum, include the following:

- Summary of required submittals, documentation, and QC testing results outlined in Contractor's Construction Quality Assurance Plan (CQA)
- Daily reports prepared by the Quality Assurance Engineer.
- Record drawing(s) (panel layout with all associated data) received and approved by the QA Engineer.
- Subgrade acceptance certificates for each area to be covered by the cap system, signed by the Contractor's Installer and the Contractor.
- Relevant completed QA data sheets from Appendix A.

### 4.5 Geocomposite Drainage Layer 2 (Surface water infiltration drainage)

The cap cross-section will utilize two layers of drainage net. The geocomposite drainage layers (GDLs) will be both directly above and below the 60-mil geomembrane layer as shown on drawing C-301 in "100% Specifications and Design Drawings." The GDL above the membrane is allow for drainage and transport of infiltrated surface water, and the GDL below the membrane is for gas venting. This section focuses on the installation of the GDL above the membrane.

The specification requirements for the geomembrane layer, which have been provided in Section 02374 in "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Packaging, shipment, and storage of material;
- Handling and placement requirements;
- Seaming procedures;
- Material repairs; and
- Cover soil placement for the GDL above the geomembrane.

### 4.5.1 Quality Assurance

The geocomposite manufacturer shall provide certified copies of laboratory test results on the following specifications listed in Appendix A.

The Construction Contractor will furnish the certified test results for all geocomposite placed to the QA Engineer for review as part of the required shop submittals. The EOR, or EOR representative, will review the test results for conformance with the criteria included in the contract specifications.

The GDL QA/QC forms have been provided as Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Section 02372 of "100% Specifications and Design Drawings" and note deviations from technical specifications;
- Observe subgrade preparation;
- Overlapping and connection procedures;
- Material repairs; and
- Documentation to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Capping System Subcontractor will be submitted to the Independent QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the Independent QA Engineer. The report sections outlining the geocomposite layer shall, at a minimum, include the following:

- Daily reports prepared by the Independent QA Engineer; and
- Daily construction progress reports clearly showing geocomposite placed by date.

## 4.6 Root Barrier

The capping system shall contain a woven geotextile root barrier layer. This barrier layer is located directly above the GDL cover soil layer, as indicated in drawing C-301 in "100% Specifications and Design Drawings."

The specification requirements for the geotextile layer, which have been provided in Section 02373 of "100% Specifications and Design Drawings" and summarized on Table 1, includes, but are not limited to:

- Product materials;
- Application of geotextile; and
- Installation of geotextile fabrics.

### 4.6.1 Quality Assurance

The QA/QC forms have been provided as Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, are not limited to:

- Confirm work has been completed in accordance with Section 02373 of "100% Specifications and Design Drawings" and note deviations from technical specifications;
- Observe geotextile installation;
- Overlapping;
- Material repairs; and
- Documentation to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Contractor will be submitted to the QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the QA Engineer. The relevant sections of report outlining the geotextile layer shall, at a minimum, include the following:

- Daily reports prepared by the QA Engineer; and
- Daily construction progress reports clearly showing geotextiles placed by date.

## 4.7 Geosynthetic Clay Liner

The geosynthetic clay liner (GCL) shall be used as a secondary hydraulic barrier in locations where the cap may be submerged below the groundwater table, as indicated on drawing C-309 provided in "100% Specifications and Design Drawings."

The specification requirements for the clay liner, which have been provided in Section 02375 in "100% Specifications and Design Drawings" as well as summarized on Table 1, includes, but are not limited to:

- Material delivery, handling, and storage;
- GCL placement;
- Seaming; and
- Damage repairs.

### 4.7.1 Quality Assurance

The various technical specifications pertaining to the GCL are outlined within the QA/QC forms contained within Appendix A. The forms outlined in Appendix A shall be used as a guideline for the typical information required for the submittal. Actual form submitted by the Contractor may vary from those presented. The QA engineer observations may include, but are not limited to:

- Confirm work has been completed in accordance with Specification Section 02375 and note deviations from technical specifications;
- Observe geotextile installation;
- Observe overlapping and seaming of GCL;
- Material repairs;

- Observe GCL hydration; and
- Documentation to demonstrate compliance.

All testing and installation documentation referenced above that is developed by the Contractor will be submitted to the Independent QA Engineer for review. Copies of all of this documentation will be included as part of the Cap Geosynthetics QA Report prepared by the QA Engineer. The certification report for the GCL shall, at a minimum, include the following:

- Daily reports prepared by the QA Engineer; and
- Daily construction progress reports clearly showing GCL placed by date.

### 4.8 Earthwork

As shown on drawing C-301 in "100% Specifications and Design Drawings," the soil materials used in the construction of this capping system consist of the following layers:

- Geocomposite drainage soil;
- Planting soil layers consisting of topsoil underlain by soil layers capable of support tree and shrub growth;
- Structural fill to be placed under roadways;
- Common borrow placed in select areas under roadways or to raise the subgrade to appropriate elevations.

The relevant quality control/quality assurance observations and specifications governing placement and testing of each layer are summarized in a separate Construction Quality Control Plan prepared by AmecFW.

## 5.0 CAP GEOSYNTHETICS QA REPORT

The QA Engineer in conjunction with the EOR and Contractor shall prepare a Cap Geosynthetic QA Report documenting work completed in this CQA Plan. This report shall contain at a minimum:

- As-built drawings from the Contractor;
- Conformed technical specifications from the EOR;
- Summary of DCB, submittals, and RFIs by the EOR;
- Reference to the QC data reported by the Contractor;
- Summary of QA/QC forms outlined in Appendix A prepared by the Independent QA Engineer and Contractor; and
- Photographic logs and QA/QC forms by the Independent QA Engineer.

| | | |
| | Total Linear Feet of Tie in to Existing | |
| | Total Linear Feet of Tie in Slope to Floor | |

The Quantities Listed Above Are Based On The Following :

- ☐ Field measurements
- ☐ Quantities are agreed to at this time
- ☐ Quantities listed include geosynthetics in anchor trench
- ☐ Job 100% complete
- ☐ Field change orders were Issued How Many? _____

**Check All Applicable Boxes Below:**

- ☐ Quantities listed include tie in / run out details
- ☐ Quantities to be verified by survey
- ☐ Quantities listed are per completed survey
- ☐ Job is partially complete.
- ☐ Anticipated remob date is: _____

☐ The project has been left, by ESI, in a clean and orderly fashion acceptable to customer.

_____
Initial by Customer / Rep

☐ All work has been found satisfactorily completed and the work satisfies the Project plans and specifications

_____

PROJECT NAME: _____ PROJECT NO: _____

LOCATION: _____

AREA ACCEPTED: _____

PANEL NUMBERS: _____

GRADE ACCEPTANCE: INSPECTOR: _____

GENERAL CONTRACTOR: _____

OWNER: _____

AUTHORIZED REPRESENTATIVE: _____

The undersigned, _____,certifies that he/she is a representative of Environmental Specialties International, Inc. authorized to execute this certificate, that he/she has visually inspected the subgrade surface described above on _____ and found the surface to be acceptable for installation of the geomembrane.

This certification is based on observation of the surface of the subgrade only. No subsurface inspections or test have been performed and Environmental Specialties International, Inc. makes no representations or warranties regarding conditions which may exist below the surface of the subgrade.

# Certificate of Completion

Sheet # 1

| | | | | | |
|---|---|---|---|---|---|
| Project Name | Honeywell SA-6 South | Material Desc. | LLDPE Geomembrane Cap | | |
| Project No. | 100530001 | Layer | **Primary** | Secondary | Tertiary |
| Owner/ Contr. | Honeywell / AmecFW | Type | Partial | Substantial | **Final** |
| QA Monitor | Langan | Date | 12/01/2015 | | |

Description and Area of Work Being Certified: Completion of capping of SA-6 South which included: placement of GVL/GCL, placement of LLDPE geomembrane, and placement of GDL. Material was placed in accordance with the Record Drawings and project specifications. To date, the geosynthetic components of SA-6 South are complete and summarized in the *QA Completion Report*.

I hereby certify that the above identified work has been inspected and it has been properly installed. I further certify all required testing has been completed and the results are acceptable to the CQA Officer. The liner system is suitable for its intended use.

1 This is the design elevation at Construction Control Grid Points.

2 Deviation = Surveyed Elevation - Design Elevation

Points in 0.1 - 0.5 ft. tolerance are due to a slight overcut in the top of slopes where it wouldn't be suitable for backfill due to compaction difficulties.

2 Deviation = Surveyed Elevation - Design Elevation

**Per SPECIFICATION 01460 SURVEY. SECTION 1.05 F. Spot Elevations - Survey shall be constructed to provide an accuracy of 0.1 feet vertically. Ninety percent of all spot elevations placed on the maps shall have an accuracy of at least 0.1', and the remaining 10 percent shall not be in error by more than one-half (1/2) the contour interval (0.5'). Break points added to replace Grid Points that fell on slopes and Boundary Points will be treated as Spot Elevations as defined in Section 1.05 F.**

**Maser Consulting P.A. certifies that the elevations, with their corresponding date obtained, of the Grid Points depicted in Table 1, Break Points in Table 2, Boundary Points in Table 3, and topographic spot elevations are correct, and representative of the as-built cap subgrade throughout the SA6 South cap.**

# CERTIFICATE OF SUBGRADE SURFACE ACCEPTANCE

INSTALLER: ENVIRONMENTAL SPECIALTIES INTERNATIONAL, INC.

PROJECT NAME: Honeywell Chromium Area PROJECT NO: 12-11-1399

LOCATION: Jersey City, NJ

AREA ACCEPTED: Aprox. 11,070 SF

PANEL NUMBERS: P- 98 to 106 Over subgrade and some over GCL

GRADE ACCEPTANCE: INSPECTOR: AMEC

GENERAL CONTRACTOR: ENTACT

OWNER: Honeywell

AUTHORIZED REPRESENTATIVE:

The undersigned, Fortino Ayala ,certifies that he/she is a representative of Environmental Specialties International, Inc. authorized to execute this certificate, that he/she has visually inspected the subgrade surface described above on 18-Sep and found the surface to be acceptable for installation of the geomembrane.

This certification is based on observation of the surface of the subgrade only. No subsurface inspections or test have been performed and Environmental Specialties International, Inc. makes no representations or warranties regarding conditions which may exist below the surface of the subgrade.

# Certificate of Soil Surface

Sheet # 18

| | | | | | |
|---|---|---|---|---|---|
| Project Name | Honeywell SA-6 South | Material Desc. | Geomembrane | | |
| Project No. | 100530001 | General Desc. | (Subgrade) | Operations | LCRS |
| Owner/ Contr. | Honeywell / Arlec FW | Cell No. | ~Sta. 7+70 to ~Sta. 7+00 | | |
| QA Monitor | Langan | Date | 9/17/15 | | |

Description of Soil Surface to be lined: ~70 ft. Section of Soil Subgrade Approved East of Geomembrane Panels Installed on 9/16/15 (P-94). Subgrade Approved From Approximate Sta. 7+70 (P-94) to Approximate Sta. 7+00 (western slope of 3rd utility corridor). Soil Appears to be Graded, Compacted, And Free of Debris (>1½") and in conformance with Project Specs.

I hereby certify that the above surface area is suitable for the installation of geosynthetics, and I shall be responsible for its integrity and suitability in accordance with the specifications from this date to the completion of the installation.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/7/2015 |
| **PROJECT:** | SA-6 Capping | | **WEATHER:** | 75/85° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Soil Subgrade Inspection | **TIME:** | 0600 – 1400 |

| **CONTRACTOR & EQUIPMENT:** | **PERSONNEL ON SITE:** **Day #1** |
|---|---|
| **Thatcher Foundations**<br>*Equipment:* Dozer, Steel Drum Roller, Misc. Hand Tools (shovels, rakes) | **AmecFW**: Stu Bills, Dave Ambrose<br>**Langan:** Dan Bosworth, Jeff Stoicescu<br>**ENTACT**: Keith Goisse |

## ***Site Activities***

- Langan onsite to conduct soil subgrade inspection. Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area.
- Langan and ENTACT (two laborers) conducted visual inspection of the prepared soil subgrade. This area included the furthest western part of the cap (Sta. 24+00) to just east of Sta. 18+50.
- In general, the following soil subgrade properties were observed:
    - Some debris (wood fragments),small rocks, etc. were observed along the slopes and elevation changes from Sta. 24+00 to Sta. 18+50. It is recommended during the pull back and removal of the plastic tarp (in preparation for installation of liner), ENTACT should provide laborers with a wheelbarrow and equipment to collect various debris as it is encountered.
    - Along the slopes of the smaller swales, utility corridors, street channels, etc. some soft and loose material was noted. As recommended above, as the plastic is removed for liner installation activities, Entact should provide laborers to dress the slopes (i.e. remove any loose debris and conduct compaction (as required) with a hand tamper), as necessary.
- In addition to the general soil subgrade properties outlined above, some soft / wet areas (some with free standing water) were encountered. The location of these wet areas was in the general vicinity of the collection manhole (Sta. 21+00), where the soil subgrade was very soft (able to sink into the soil while walking). Langan conducted a site walk with AmecFW to collect GPS locations of these soft, underlying areas. The attached figure provides the swales, corridors, and trenches within vicinity of the collection manhole that do not meet the soil subgrade requirements. Additional grading / compaction activities will be required prior to liner installation within these areas.
    - Note: The locations on the attached figure do not represent every area that needs additional preparation activities. The general soil subgrade properties outlined above could represent varying locations as the entire soil area could not be observed due to the plastic being placed over the cap area. The locations outlined on the attached figure are meant to provide “critical” areas that may require more substantial work activities in order to have the subgrade properly prepared to the specifications.

Cc Jeff Stoicescu, Rory Johnston, Vikki Hon, File

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Observations Requiring Contractor / QA Engineer Review***

- Based on the soil subgrade inspection, the soil has not been approved for liner installation activities based on the wet / soft spots encountered (as outlined within this report). It is also recommended that laborers are provided when the plastic sheeting is removed so that the loose debris can be collected, and additional grading / compacting activities can be conducted (as required) along the slopes and contours.

***Action Items Pending***

- QA Engineer - Review SA-6 capping specifications and drawings. Review product submittals (as provided) and ensure that all data, drawings, and pertinent documents are ready for liner installation kickoff (planned for the week of 7/13).

***Action Items – Weekly Completions***

- None to Date

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Cap Installation Kickoff meeting scheduled for Thursday (7/9/15). At this time an additional soil subgrade inspection should be conducted with ESI representatives.

Photo 8: Soft / wet soil in vicinity of manhole. Indentations / footprints visible.

LANGAN

Notes:
1. Locations GPS surveyed by Langan and AMEC for soil subgrade areas requiring additional preparation activities prior to liner placement.
2. This Figure represents critical locations that were observed by the project team and does not include every area that may require additional preparation work. As the plastic sheeting is removed from the cap, ENTACT should provide sufficient manpower to remove potential miscellaneous debris, and re-grade / compact slopes, as required.
3. Subgrade observations collected on 7/7/15 and 7/13/15 by Langan field personnel and represent the areas between the western most boundary (Sta 24+00), and east of Sta17+50. The area to the east of Sta. 17+50 has not yet been observed.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/13/2015 |
| **PROJECT:** | SA-6 Capping | | **WEATHER:** | 80/90° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Soil Subgrade Inspection | **TIME:** | 0600 – 1100 |

| **CONTRACTOR & EQUIPMENT:** | **PERSONNEL ON SITE:** **Day #2** |
|---|---|
| **Thatcher Foundations**<br>*Equipment:* Dozers, Steel Drum Rollers, Misc. Hand Tools (shovels, rakes) | **AmecFW**:Stu Bills, Dave Ambrose, Ari Eslaminejad<br>**Langan:** Dan Bosworth<br>**ENTACT**: Keith Goisse |

## ***Site Activities***

- Langan onsite to conduct soil subgrade inspection, and to observe placement of first layer of geocomposite (gas venting layer) for SA-6 south capping. Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area.
- Based on subsequent conversations with the project team, no material was to be placed during the day (GDL or LLDPE) as the geomembrane was undergoing final conformance testing requirements and had not yet been delivered to the Site. As such, Langan and AmecFW conducted a visual inspection of the prepared soil subgrade. These areas included the locations previously identified during the Day #1 soil subgrade inspection, as well as additional areas completed since that date from Sta. 18+50 to Sta. 17+50, as shown in the attached Figure (Sheet 7).
- In general, the following soil subgrade properties were observed:
  - ENTACT had opened and dried the areas immediately west of the collection manhole. Additionally, ENTACT provided laborers to dress and repair the slopes, as required. Refer to Sheet 3 for example of slope that would require dressing. The additional areas east of the collection manhole will also be opened and dried, with additional preparation being completed, as required. Refer to Sheet 7 for areas that ENTACT has repaired soil to appropriate subgrade.
  - The slopes of the smaller swales, utility corridors, street channels, etc. some soft and loose material was noted. As the plastic is removed for liner installation activities, ENTACT should provide laborers to dress the slopes (i.e. remove any loose debris and conduct compaction (as required) with a hand tamper), as necessary.
- In addition to the general soil subgrade properties outlined above, some soft / wet areas (some with free standing water) were encountered east of the previously inspected areas. The coordinates of these locations were collected and are shown on Sheet 7. Additional grading / compaction activities will be required prior to liner installation within these areas.
  - Note: The locations on the attached figure do not represent every area that needs additional preparation activities. The general soil subgrade properties outlined above could represent varying locations as the entire soil area could not be observed due to the plastic being placed over the cap area.

Cc Jeff Stoicescu, Rory Johnston, Vikki Hon, File

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

The locations outlined on the attached figure are meant to provide "critical" areas that may require more substantial work activities in order to have the subgrade properly prepared to the specifications.

***Observations Requiring Contractor / QA Engineer Review***

- Based on the soil subgrade inspection conducted to date, it appears that the soil west of the collection manhole is acceptable to commence with installation activities. However, ENTACT shall provide laborers as the plastic is removed to conduct slope dressing and re-compaction (as required), as well as, to remove any unacceptable debris (i.e. rocks, misc. debris, etc.) from the subgrade. If further soil deterioration is encountered prior to the placement of the GDL and liner material, additional re-grading and re-compaction of the soil subgrade may be required. As such, the final soil subgrade inspection form will not be completed until immediately prior to GDL and liner placement.
- Based on the wet / soft spots encountered (as outlined within this report) east of the collection manhole, it appears that this soil subgrade is not suitable for liner installation activities. Additional preparation work (i.e. drying, re-compaction, etc.) is required prior to liner placement. It is also recommended that laborers are provided when the plastic sheeting is removed so that any loose debris can be collected, and additional grading / compacting activities can be conducted (as required) along the slopes and contours.

***Action Items Pending***

- QA Engineer - Review SA-6 capping specifications and drawings. Review product submittals (as provided) and ensure that all data, drawings, and pertinent documents are ready for liner installation kickoff (planned to commence on 7/15).

***Action Items – Weekly Completions***

- None to Date

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work will be conducted tomorrow (7/14) by ENTACT.
- Preparation and coordination to ensure that liner placement can begin on Wednesday (7/15).

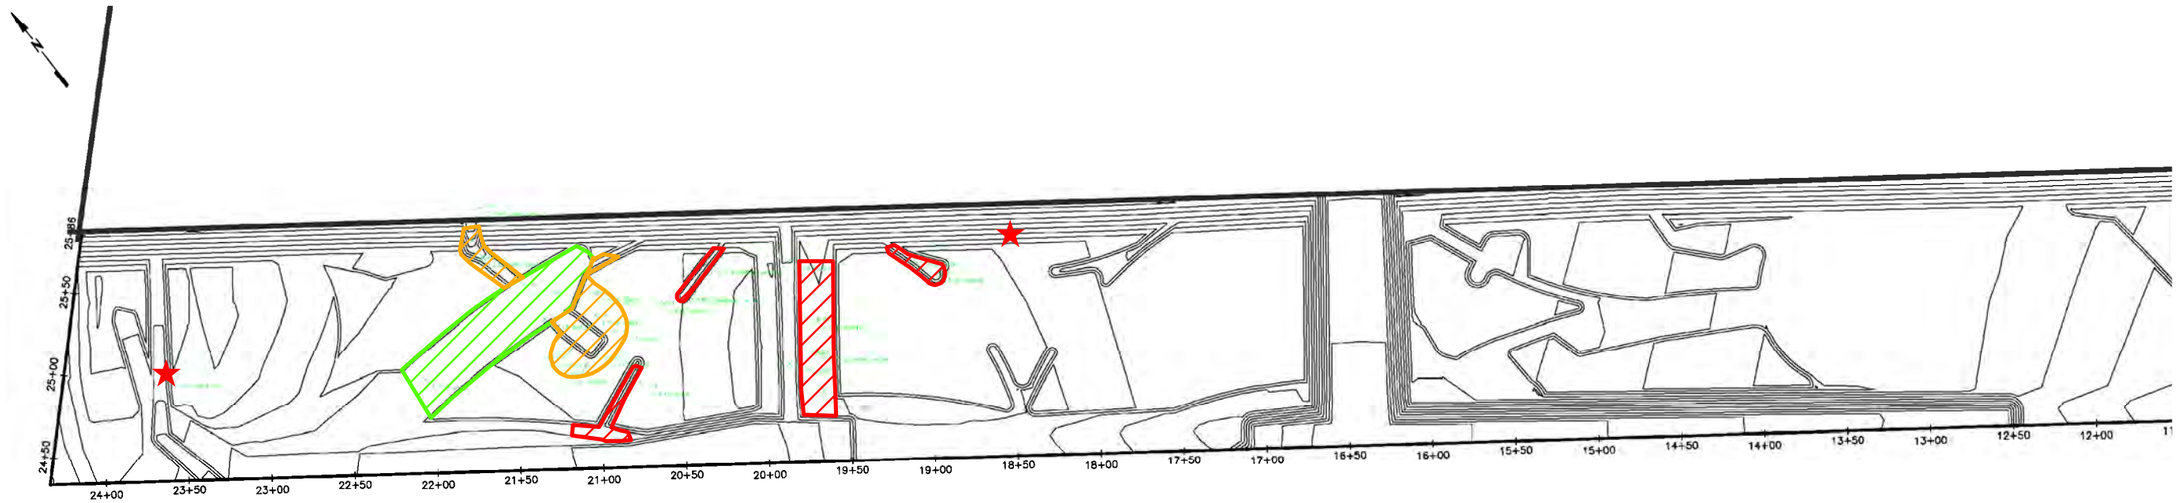
Photo 3: ENTACT dressing slopes west of collection manhole.

Photo 4: Area west of collection manhole. Opened and dried. ENTACT dressing slopes (as required).

***Photograph Log (continued)***

Photo 5: Wet area located east of collection manhole on top deck (still requires drying and re-compaction).

Photo 6: Dry area re-compacted west of collection manhole.



***Photograph Log (continued)***

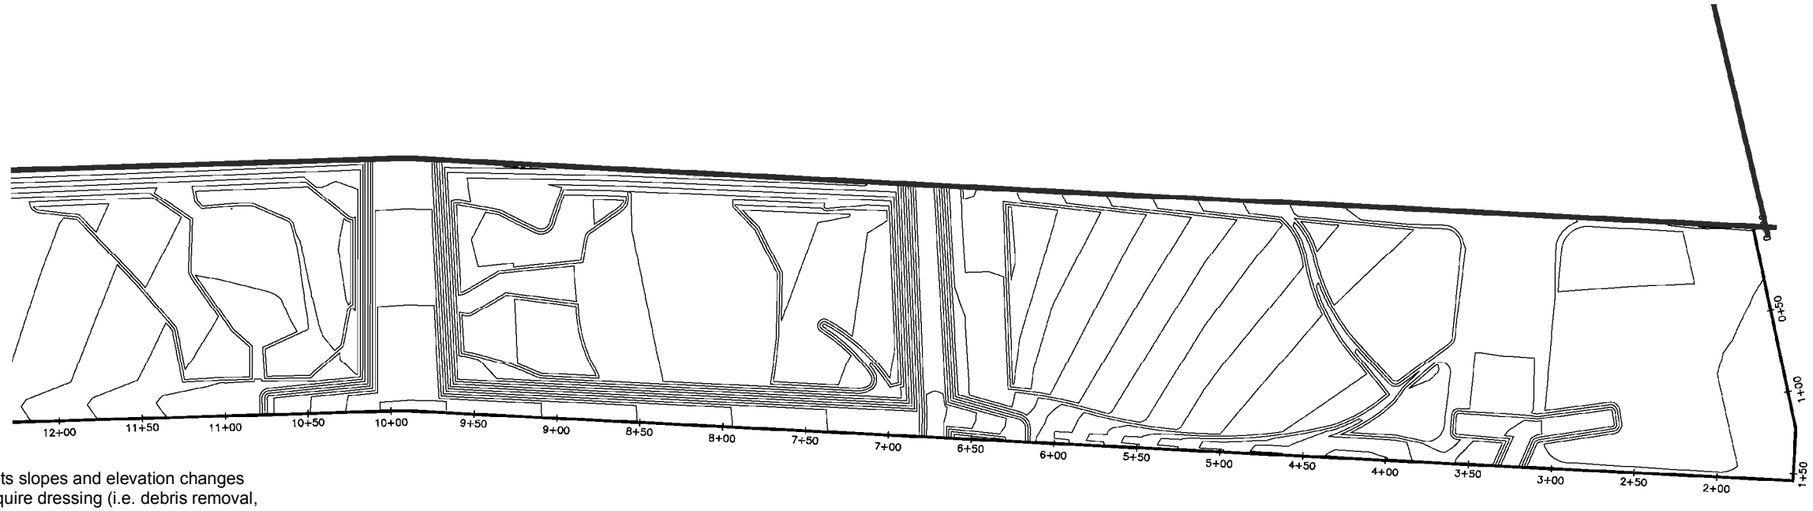


Photo 7: ENTACT filling and re-compacting depressions / voids in subgrade along southern edge of SA-6.

Photo 8: Grading and compacting soil east of collection manhole near Sta. 17+50.

## Legend

★ Respresents slopes and elevation changes that will require dressing (i.e. debris removal, re-compaction, etc.)

## Status

Represents areas that have been dried, regraded, and re-compacted. Soil appears acceptable for liner placement

Represents areas where ENTACT is presently drying and conducting regrading and re-compaction as required.

Represents areas that exhibit soft / wet subgrade. Soil not acceptable for liner placement.

Notes:
1. This Figure represents critical locations that were observed by the project team and does not include every area that may require additional preparation work. As the plastic sheeting is removed from the cap, ENTACT should provide sufficient manpower to remove potential miscellaneous debris, and re-grade / compact slopes, as required.
2. Subgrade observations collected on 7/7/15 and 7/13/15 by Langan field personnel and represent the areas between the western most boundary (Sta 24+00), and east of Sta17+50. The area to the east of Sta. 17+50 has not yet been observed.

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #3**<br>**AmecFW**:Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad<br>**Langan:** Dan Bosworth, Jeff Stoicescu<br>**ENTACT**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) starting at the west end of the SA-6 south. Material to be placed from the western end (west of Sta. 24+00, located at approximate Sta. 24+35) of SA-6 for approximately 100 ft. east to approximate Sta. 23+35.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area).
- Prior to placement of GVL or Cap, the plastic sheeting protecting the soil subgrade from the work area was removed. Final soil subgrade inspection was conducted for the area outlined above. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3, 4, and 5 of the daily photo log for 7/20/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the area of approximate Sta. 24+35 to Sta. 23+35 as outlined above.
- Upon soil subgrade approval, and prior to placement of the GVL and Liner, it was determined that an onsite meeting to discuss the revised panel layout and placement would be conducted between AmecFW, Langan, and ENTACT. During this meeting, the revised panel layout, seaming, soil subgrade approval, and other pertinent issues were discussed. Upon review of these topics, it was determined that ESI could begin with placement of GVL and Liner.
- ESI began by placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed on the western end of the Site (Sta. 24+35) moving east. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to 7/20/15 Photo Log for supporting photographs.
- After installation of GVL, geomembrane liner was installed beginning at the western end of the Site and moving east. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from Sta. 24+35 to approximate Sta. 23+35. A total of four panels were installed (P-1, P-2,

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

P-3, and P-4), with seams overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing. The results of the pre-trial weld are provided in the associated QA form submitted for today (7/20), *Trial Weld Log.*

- Upon installation and welding of the geomembrane panels, based on required working permit hours, it was determined that non-destructive testing, and liner repair work would be conducted on 7/21/15. A destructive sample (DS-1) was collected, however, this sample was not shipped on 7/20/15 due to the extended working hours. Sample to be recorded on the *Destruct Log* and shipped on 7/21/15.

## ***Non-Conformance Items / Corrective Actions***

- None Encountered.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log. Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, etc.)
- Review laboratory results for destruct sample DS-1.

## ***Action Items – Weekly Completions***

- None to Date

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 23+35 to Sta. 22+35).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) continuing from western end of SA-6 South. Material to be placed from Panel #4 (P-4) installed on 7/20/15 (located at approximate Sta. 23+25) running approximately 100 ft. east (Sta. 22+35).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting non-destructive testing and patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/20/15 (Panels 1-4). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed with the project specifications (refer to *Preweld Test Report* for 7/21/15 for results).
- A total of eight repairs (RP-1 through RP-8) were observed and fixed (according to the project specifications) from Panel #1 through Panel #4. The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted, as outlined in the project specifications.
- Some non-conformance issues were observed, outside of the "custom fit" repairs noted above (refer to *Notice of Non-Compliance and Corrective Action* forms), and were documented on Sheet #1 and Sheet #2 as non-compliance. These issues were also recorded within the *Repair Log* as a subgrade irregularity and are identified as RP-3 and RP-8. The non-compliance issues encountered were identified based on debris / rocks that were observed underneath the geomembrane cap. The rocks were removed from these areas and the hole was patched / repaired according to the project specifications and further outlined in the *Non-Compliance and Corrective Action* forms – *Sheet #1* and *Sheet #2* for 7/21/15.
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/20/15, Entact removed the plastic sheeting protecting the soil subgrade for the next 100 ft. section of work area (approximate Sta. 23+35 to Sta. 22+35). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/21/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed.

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to *Photos #9 & 10* of the daily photo log for 7/21/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 23+35 to Sta. 22+35 as outlined above.

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 23+35 (east of P-4) moving east (for approximately 100 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *7/21/15 Photo Log* for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #4 (located at approximate Sta. 23+35) on 7/20/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 23+35 to Sta. 22+35. A total of four panel lengths were installed (P-5, P-6, P-7, P-8, P-9) by ESI. Note: Encountered the end of the geomembrane roll while placing Panel #6 (P-6). Butt seam required between P-6 and P-7. A destructive test sample (DS-2) was also collected from this seam (one sample for ESI, and one sample for Langan). The results of trial welding test for the destructive sample are outlined in the *Preweld Test Report* for 7/21/15. A total of ten 1-inch specimens were collected for peel and shear strength testing (5 tests for each).
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/20), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted patch / repair work and non-destructive testing on Panels 5-9 (as outlined in the project specifications). During the non-destructive testing conducted between Panel 7 (P-7) and Panel 8 (P-8), the non-destruct test failed and a non-compliance issue was noted. Since P-7 only extended approximately 6 ft. (north to south), the entire seam would be patched and repaired (according to the project specifications) on 7/22/15.
- It should also be noted that pipe booting activities were conducted on piezometer PZ20 and well 073-MW-1BR as outlined in the project specifications. These two penetrations were sealed with geomembrane according to the project specifications. However, the final clamps with gasket have not yet been installed. The *Gas Vent and Piezometer Penetrations* Form will be filled and out and confirmed by Langan and ESI once these activities are completed.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 1 (Sheet #1) – Subgrade irregularity identified as RP-3 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #2). Stone was subsequently removed, and hole was patched/repaired following project specs and further defined in *Sheet 1 Notice of Non-Compliance*
- Non-Conformance No. 2 (Sheet #2) – Subgrade irregularity identified as RP-8 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #2). Stone was subsequently removed and hole was patched/repaired following project specs and further defined in *Sheet 2 Notice of Non-Compliance.*

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Non-Conformance No. 3 (Proposed Sheet #3) – Failed seam
    - During non-destruct testing of P-7 and P-8 (6 ft. run north to south), the test failed as pressure could not be held within 4 psi (as outlined in project specifications). ESI will patch and repair the entire 6 ft. seam length (according to project specs) and this non-compliance issue will be documented on 7/22/15 and issued a repair number.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/21/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.)
- Review laboratory results for destruct sample DS-2. Note: QA destruct sample also collected (DS-2) by Langan.

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Reviewed laboratory destruct sample results for samples DS-1. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 22+35 to Sta. 21+35).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

## ***Daily QA Documents Completed***

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/22/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 70/82° F, Clear, Sunny, Wind (15 mph) |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1600 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #5**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #9 (P-9) installed on 7/21/15 (located at approximate Sta. 22+35) running approximately 95 ft. east to Sta. 21+40.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting non-destructive testing and patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/21/15 (Panels 5-9). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed with the project specifications (refer to *Preweld Test Report* for 7/22/15 for results. Extrusion testing identified with as EXT on form).
- A total of six repairs (RP-9 through RP-14) were observed and fixed (according to the project specifications) from Panel #5 through Panel #9. The majority of these repairs were associated with piezometer pipe boots and repairs for the destructive samples collected. These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- One non-conformance issue was observed, outside of the repairs noted above (refer to *Notice of Non-Compliance and Corrective Action* forms), and was documented on Sheet #3 as non-compliance. This issue was also recorded within the Repair Log as a failed seam test (non-destruct test) and identified as RP-13.
- The non-compliance issue encountered was a failed non-destructive seam test conducted between Panels 7/8. The failed seam was along the southern end of SA-6 and was only 6 ft. in total length (butt end of seam as outlined in the 7/21/15 report). As such, the seam was patched according to the project specifications and further outlined in the *Non-Compliance and Corrective Action* forms – Sheet #3 for 7/21/15.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Upon completion of the cap detailing, ESI began to install GDL panels beginning at the western end of the Site (Sta. 24+35) and moving east. The GDL panels were installed over the geomembrane cap previously placed on 7/20/15, and were installed to just before the first destructive sample collected (DS-1) along Panels 3/4.
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/21/15 and installing GDL, Entact removed the plastic sheeting protecting the soil subgrade for the next 95 ft. section of work area (approximate Sta. 22+35 to Sta. 21+40). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/22/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #2 & 3 of the daily photo log for 7/22/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 22+35 to Sta. 21+40 as outlined above.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 22+35 (east of P-9) moving east (for approximately 95 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to 7/22/15 Photo Log for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #9 (located at approximate Sta. 22+35) on 7/21/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 22+35 to Sta. 21+40. A total of four panel lengths were installed (P-10, P-11, P-12, and P-13) by ESI.
- A destructive test sample (DS-3) was collected from the Panel 10/11 seam, within the 500 ft. linear foot requirement outlined in the project specifications. The results of trial welding test for the destructive sample are outlined in the *Preweld Test Report* for 7/22/15. A total of ten 1-inch specimens were collected for peel and shear strength testing (5 tests for each).
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/22), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted patch / repair work and non-destructive testing on Panels 10-13 (as outlined in the project specifications). The patches associated with Panels 10-13 will be completed with extrusion welds on 7/23/15.
- It should also be noted that pipe booting activities were conducted well 115-W3-SO (located on Panel #8, northern slope) as outlined in the project specifications. The penetration was sealed with geomembrane according to the project specifications. However, the final clamps with gasket have not yet been installed. The *Gas Vent and Piezometer Penetrations* Form will be filled and out and confirmed by Langan and ESI once these activities are completed. Additionally, a gas vent pipe (GV-7) was covered with geomembrane, and will be cut, sealed, and booted according to the specifications at a future date.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 3 (Sheet #3) – Failed seam, identified as RP-13 on *Repair Log*
    - During non-destruct testing of P-7 and P-8 (6 ft. run north to south), the test failed as pressure could not be held within 4 psi (as outlined in project specifications). This area was patched and repaired along the entire 6 ft. seam length (according to project specs) as outlined on *Sheet #3*

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

*Notice of Non-Compliance*.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/22/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/21/15.
- Review laboratory results for Destruct Sample (DS-3)

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/21/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Destructive Sample Summary,* and *Certificate of Subgrade Acceptance* forms. Additional review of Preweld Test Report, Seam Control Form, and Repair Report required prior to acceptance.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-2, as well as Langan QA sample (DS-2). Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 21+40 to Sta. 20+40).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/23/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 70/82° F, Clear, Sunny, Wind |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1630 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #6**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #13 (P-13) installed on 7/22/15 (located at approximate Sta. 21+40) running approximately 150 ft. east to Sta. 19+90.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI deploying GDL along the western end of the cap. Based on the minor repairs required from the geomembrane placement on 7/22/15, it was determined that extrusion weld repairs would be conducted tomorrow (7/24/15).
- A total of 11 rolls (7 north to south runs over SA-6; approximately 165 ft.) of GDL were deployed along the western end of SA-6. GDL was installed to cover the geomembrane panels placed on 7/20/15 and 7/21/15 (GLD installed up to P-9). Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and geotextile seams sewn along the geotextile for adjacent panels.
- While ESI was and installing GDL along the western end of SA-6, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 150 ft. section of work area (approximate Sta. 21+40 to Sta. 19+90). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/23/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3,4,5, and 6 of the daily photo log for 7/23/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 21+40 to Sta. 19+90 as outlined above.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After geotextile was placed, GVL was installed from approximate Sta. 21+40 (east of P-13) moving east (for approximately 150 ft.) to Sta. 19+90. GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally the top panel of geotextile was sewn along the seams (according to the project specifications). Refer to 7/23/15 Photo Log for supporting photographs.

- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #13 (located at approximate Sta. 21+40) on 7/22/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 21+40 to Sta. 19+90. A total of five panel lengths were installed (P-14, P-15, P-16, P-17 and P-18) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/23), *Trial Weld Log.*
- As outlined above, no extrusion welding and detailing activities were conducted by ESI. These activities are scheduled to be completed tomorrow (7/24) for the repairs associated with geomembrane capping from 7/22/15 and 7/23/15. It should also be noted that two destructive fusion weld samples will be collected on 7/24/15 from Panels 14-18. An extrusion weld sample will also be required once detailing activities commence in the morning.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items to be recorded from 7/23/15 as no repair work was completed.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/23/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/21/15 and 7/22/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- ESI – complete repair / patch work and collect appropriate destruct samples for fusion and extrusion welding (as outlined in project specifications.

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, as well as reviewed and approved ESI submitted forms.
- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/21/15 and 7/22/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Destructive Sample Summary,* and *Certificate of Subgrade Acceptance* forms. Additional review of Preweld Test Report, Seam Control Form, and Repair Report required prior to acceptance.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-3. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 19+90 to Sta. 19+00).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/24/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 75/90° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1700 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #7**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #18 (P-18) installed on 7/23/15 (located at approximate Sta. 20+25) running approximately 90 ft. east to Sta. 19+00. Note: Soil subgrade approved to approximate Sta. 19+90 on 7/23/15. Geomembrane cap only installed to approximate Sta. 20+25 by ESI (additional 35 ft. of approved subgrade in addition to 90 ft. approved on 7/24/15).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/23/15 (Panels 14-18). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/24/15 for results (extrusion testing identified as EXT. on form).
- A total of seventeen repairs (RP-15 through RP-31) were observed and fixed (according to the project specifications) from Panel #9 through Panel #18 (repair / detailing work conducted on panels installed from 7/22/15 and 7/23/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications. Some additional repairs (including “custom fit” cuts to conform the geomembrane) required, however, these repairs will be completed on Monday (7/27) to allow ESI to continue to place geomembrane to the east.
- One extrusion weld destruct sample (DSX-1) was collected from Panel #13 (located on RP-17). Extrusion weld destruct samples collected every 500 lf. of welding (as outlined in project specs).
- One non-conformance issue was observed, outside of the repairs noted above (refer to *Notice of Non-Compliance and Corrective Action* forms), and was documented on Sheet #4 as non-compliance. This issue was also recorded within the Repair Log as a subgrade irregularity and was noted and repaired (RP-30) following the project specifications.

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- While ESI was conducting cap detailing for the geomembrane cap placed on 7/22/15 and 7/23/15, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 90 ft. section of work area (approximate Sta. 19+90 to Sta. 19+00). Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/24/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #8 & 9 of the daily photo log for 7/24/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 19+90 to Sta. 19+00 as outlined above.
- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 20+25 (east of P-18) moving east (for approximately 135 ft. total [35 ft. remaining from 7/23/15 + 90 ft. approved on 7/24]). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Along the slopes and elevation changes, additional fasteners were placed along the geonet to provide additional support within these sloped areas. Additionally the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to 7/24/15 Photo Log for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #18 (located at approximate Sta. 20+25) on 7/23/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 20+25 to Sta. 19+00. A total of six panel lengths were installed (P-19, P-20, P-21, P-22, P-23, P-24) by ESI.
- Two destructive test samples (DS-4 & DS-5) were collected from the Panel 14/15 and 17/18 seam, within the 500 ft. linear foot requirement outlined in the project specifications. The results of the trial welding tests for the destructive samples are outlined in the *Preweld Test Report* for 7/24/15. A total of ten 1-inch specimens were collected for peel and shear strength testing (5 tests for each) for each sample.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/24), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted non-destructive testing on Panels 19-24 (as outlined in the project specifications). No patch / repair work on the installed panels was conducted. Patches associated with Panels 19-24 will be completed with extrusion welds and vacuum box testing on Monday (7/27/15). Additionally, some additional patchwork for the panels installed on 7/23/15 will also be completed, as outlined above.

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 4 (Sheet #4) – Subgrade irregularity identified as RP-30 on *Repair Log*
    - Stone identified underneath geomembrane cap (Panel #17). Stone was subsequently removed, and hole was patched/repaired following project specs and further defined in *Sheet 4 Notice of Non-Compliance*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/24/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/23/15 forms.

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- Review laboratory test results for destruct samples DS-4 and DS-5 (fusion) and DSX-1 (extrusion). Note: QA sample (DSX-1) also collected by Langan.

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/23/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Destructive Sample Summary,* and *Certificate of Subgrade Acceptance* forms. Submittal of additional forms from 7/23/15 and review of Seam Control Form, required prior to acceptance.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-3. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 19+00 to Sta. 18+00).
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/27/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 80/90° F, Hazy, Light Rain |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1645 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #8**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #24 (P-24) installed on 7/24/15 (located at approximate Sta. 19+00) running approximately 100 ft. east to Sta. 18+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI deploying GDL along the western end of the cap. GDL was placed to approximate Sta. 21+00 (near collection manhole) which included the placement of 9 rolls (14 different panels) of GDL from P-9 (geomembrane installed on 7/21/15) to P-14 (geomembrane installed up to 7/23/15). Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and sewing of the geotextile completed for adjacent geocomposite panels.
- While ESI was and installing GDL along the western end of SA-6, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 80 ft. section of work area (approximate Sta. 19+00 to Sta. 18+20). Based on visual inspection of the soil, two areas were identified that did not meet the subgrade requirements.
    - The drainage swale located along Sta. 19+00 at Break Point 675-18.54 collected rainwater from storms on 7/26/15. As such the area was soft / wet and did not meet the subgrade requirements. The installed geomembrane and GVL (from 7/24/15) was pulled back and this area was left open to dry. Refer to Photo #2 of 7/27/15 Photo Log.
    - An additional location was identified to the southern end of the SA-6 cap near approximate Bound Point 655-15.58. The 16 oz. geotextile was pulled back from this area and the soil subgrade was allowed to dry. Refer to Photo 3 of 7/27/15 Photo Log.
- Based on the information outlined above, no soil subgrade was approved for GVL and geocomposite placement, as the soil did not conform with the project specifications. As such, no soil subgrade approval forms were completed for 7/27/15.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- With no subgrade approval for additional panel placement (no panel layout forms completed for 7/27/15), ESI conducted patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/23/15 and 7/24/15 (Panels 19-24). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/27/15 for results (extrusion testing identified as EXT. on form).
- A total of twenty-one repairs (RP-31 through RP-51) were observed and fixed (according to the project specifications) from Panels #18 through Panel #24 (repair / detailing work conducted on panels installed from 7/23/15 and 7/24/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications. Note: No non-compliance issues were observed as patch / repair work conducted consisted primarily of custom fit repairs to allow geomembrane to conform to SA-6 contours.
- A total of three non-destructive samples were collected for lab testing (as outlined in the project specs). Two fusion weld samples DS-6 (panel seams 20/21) and DS-7 (Panel seams 23/24), along with one extrusion weld sample DSX-2 (south end of SA-6 on P-15) were collected within the 500 linear foot specification requirements.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as no new geomembrane panels were placed and the repairs associated with 7/27/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/23/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Trail Weld Log, Seam Control, and Repair Report identified on 7/21/15 and 7/22/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Review laboratory test results for destruct samples DS-6 and DS-7 (fusion) and sample DSX-2 (extrusion).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-5 (fusion) and destruct sample DSX-1 (extrusion). Note: QA sample (DSX-1) also reviewed and in compliance with project specs. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 19+00 to Sta. 18+00) to ensure soil subgrade complies with project specs.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/28/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 78/92° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1645 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #9**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #24 (P-24) installed on 7/24/15 (located at approximate Sta. 19+00) running approximately 80 ft. east to Sta. 18+20. Note: No geomembrane placed on 7/27/15, as soil subgrade was not approved for two wet / soft areas identified at approx. Sta. 19+00 (further described in 7/27/15 report).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI finishing patch / repair work (cap detailing) and vacuum box testing for the geomembrane cap that was installed on 7/24/15 (Panels 19-24). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/28/15 for results (extrusion testing identified as EXT. on form).
- A total of thirty-six repairs (RP-52 through RP-87) were observed and fixed (according to the project specifications) from Panel #19 through Panel #24 (repair / detailing work conducted on panels installed on 7/24/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/24/15, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 100 ft. section of work area (approximate Sta. 19+00 to Sta. 18+00). The previously identified wet / soft areas along Sta. 19+00 were dried, graded, and compacted according to the project specs. Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/28/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #3,4,5 of the daily photo log for 7/28/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

The soil subgrade inspection sheet was submitted for the approximate area of Sta. 19+00 to Sta. 17+80 (west of utility corridor).

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 19+00 (east of P-24) moving east (for approximately 80 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *7/28/15 Photo Log* for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #24 (located at approximate Sta. 19+00) on 7/24/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 19+00 to Sta. 18+20. An additional approximately 40 ft. section of subgrade was approved from approximate Sta. 18+20 to Sta. 17+80 to allow ESI to place an additional two panels to the east. A total of six panel lengths were installed (P-25, P-26, P-27, P-28, P-29, P-30) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/28), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted non-destructive testing on Panels 25-30 (as outlined in the project specifications). Additionally, one extrusion weld sample (DSX-3) was collected (as per project specifications) from RP-82 and sent to the approved laboratory for analysis. No patch / repair work on the installed panels was conducted. Patches associated with Panels 25-30 will be completed with extrusion welds and vacuum box testing on Wednesday (7/29/15). Additionally, two destruct samples for the fusion welding will be collected (as required by the project specs) on 7/29/15.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 7/28/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/28/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Repair Report identified on 7/27/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Review laboratory test results for destruct sample DSX-3 (extrusion).

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15, 7/24/15, and 7/27/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-7 (fusion) and destruct sample DSX-1 through DSX-2 (extrusion). Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work for the next approximate 80 ft. run east (approximately from Sta. 17+80 to Sta. 17+00) through utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 7/24/15 |
| A3 – Photo Log | Pages 1 – 6 | Total of 12 photos outlining pertinent daily observations and descriptions for 7/28/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 7/28/15 |
| A5 – Subgrade Approval | Sheet 6 & ESI (7/28/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |
| A6 – Trial Weld Log | Sheets 1, 2 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 7/28/15. |
| A7 – Panel Placement Log | Page 6 | One panel placement log provided by ESI and confirmed by Langan for geomembrane placed on 7/28/15 |
| A8 – Destruct Seam Testing COC | Sheet 1 | Updated with destruct sample information from 7/28 |
| A9 – Seam/Non-Destruct. Test Log | Sheets 5,6,7 | Non-destruct test log provided by ESI and confirmed by Langan for geomembrane placed on 7/28/15. |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/29/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 77/92° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1715 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #10**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #30 (P-30) installed on 7/28/15 (located at approximate Sta. 17+80) running approximately 80 ft. east to Sta. 17+00 (up to 1st utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI finishing patch / repair work (cap detailing) and vacuum box testing for the geomembrane cap that was installed on 7/28/15 (Panels 25-30). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/29/15 for results (extrusion testing identified as EXT. on form).
- A total of forty-two repairs (RP-88 through RP-129) were observed and fixed (according to the project specifications) from Panel #25 through Panel #30 (repair / detailing work conducted on panels installed on 7/28/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- Additionally, pipe boots were completed (with seals and clamps) for PZ-20, 073-MW-1BR, 115-W3-SO, and GV-7, however, the final butyl seal around the top of the boot is required prior to completion of the *Pipe Boot and Penetration Logs.*
- While ESI was conducting cap detailing for the geomembrane cap placed on 7/28/15, Entact removed the plastic sheeting protecting the soil subgrade for the next approximate 80 ft. section of work area (approximate Sta. 17+80 to Sta. 17+00). Prior to soil approval, the area was spot checked for survey elevations and was approved as acceptable and within the grading requirements. Final soil subgrade inspection was conducted for this area by Langan and Entact (refer to *Soil Subgrade Approval* forms from 7/29/15). Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

Refer to Photos #5 and 8 of the daily photo log for 7/29/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 17+80 to Sta. 17+00 (up to 1st utility corridor).

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 17+80 (east of P-30) moving east (for approximately 80 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *7/29/15 Photo Log* for supporting photographs.
- After installation of GVL, geomembrane cap was installed continuing east of previously installed Panel #30 (located at approximate Sta. 17+80) on 7/28/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were installed from approximate Sta. 17+80 to Sta. 17+00. A total of four panel lengths were installed (P-31, P-32, P-33, P-34) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (7/29), *Trial Weld Log.*
- Upon installation and welding of the geomembrane panels, ESI conducted non-destructive testing on Panels 31-34 (as outlined in the project specifications). Additionally, three non-destruct samples were collected (DS-8, DS-9, and DSX-4). DS-8 was collected from Panel 26/27, DS-9 from Panel 29/30, and DSX-4 (extrusion weld) was collected from Panel #27 (RP-102).

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 7/29/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/29/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Confirm revisions for Repair Report and Seam Control identified on 7/28/15.
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 1 piezometer, and 1 gas vent).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Review laboratory test results for destruct sample DS-8 and DS-9 (fusion), along with DSX-4 (extrusion).

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15, 7/24/15, and 7/27/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance* forms.
- Completed Langan Daily Report, Photo Log, and Soil Subgrade Approval Form for 7/28/15. Revisions for Repair Report and Seam Control Form required prior to sign-off.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-7 (fusion) and destruct sample DSX-1 through DSX-3 (extrusion). Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next approximate 80 ft. run east (approximately from Sta. 17+80 to Sta. 17+00) through utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

## ***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 7/29/15 |
| A3 – Photo Log | Pages 1 – 6 | Total of 12 photos outlining pertinent daily observations and descriptions for 7/29/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 7/29/15 |
| A5 – Subgrade Approval | Sheet 7 & ESI (7/29/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |
| A6 – Trial Weld Log | Sheet 2 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 7/29/15. |
| A7 – Panel Placement Log | Page 7 | One panel placement log provided by ESI and confirmed by Langan for geomembrane placed on 7/29/15 |
| A8 – Destruct Seam Testing COC | Sheet 1 | Updated with destruct sample information from 7/28 |
| A9 – Seam/Non-Destruct. Test Log | Sheets 5,6,7 | Non-destruct test log provided by ESI and confirmed by Langan for geomembrane placed on 7/28/15. |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 7/30/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 76/85° F, Overcast, PM T-Storms |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1500 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #11**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL), and geocomposite clay liner (GVL), continuing from western end of SA-6 South. Material to be placed from Panel #34 (P-34) installed on 7/29/15 (located at approximate Sta. 17+00) through 1st utility corridor located at approximate Sta. 16+50.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work (cap detailing) for the geomembrane cap that was installed on 7/29/15 (Panels 31-34). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 7/30/15 for results (extrusion testing identified as EXT. on form).
- A total of fifteen repairs (RP-130 through RP-144) were observed and fixed (according to the project specifications) from Panels #31 through Panel #34 (repair / detailing work conducted on panels installed from 7/29/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), and also to remove wrinkles observed around changes in elevation. These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- As outlined above, no non-conformance issues were observed during repair/patch work conducted on 7/30/15, as repairs were associated with conforming the geomembrane to the SA-6 contours.
- Based on the expected weather forecast of early afternoon thunderstorms, it was determined that no GCL would be placed within the utility corridor. As such, no soil subgrade was approved for GCL placement and no panel placement forms were completed.
- ESI instead deployed GDL along the western end of the cap. GDL was placed to approximate Sta. 20+00 which included the placement of 12 rolls (rolls from north to south of SA-6; 17 different panel numbers with butt seams) of GDL from P-14 to P-21. GDL Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and sewing of the geotextile completed for adjacent geocomposite panels (with orange fabric obtained from extra roll of GDL).

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- In addition to GDL placement, Entact began to build an access ramp toward the western end of the SA-6 cap to bring in protective cover soil for placement over GDL. Prior to ramp construction, approved caution tape (as outlined in the project specs was placed at a maximum 55-inch distance on top of the GDL prior to protective cover soil being spread.
- A total of one non-destructive sample (DS-10) was collected for lab testing (as outlined in the project specs). DS-10 was comprised of a fusion weld sample from Panels 32/33.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 7/30/15 consisted of custom fit design or wrinkle removal to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/30/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 1 gas vent).
- Review laboratory destruct samples (peel and shear) for DS-10 and DSX-4

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-9, and DSX-1 through DSX-3. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work for the next 100 ft. run east (approximately from Sta. 17+00 to Sta. 16+00) through the 1st utility corridor.
- Begin placement of GCL along 1st utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 73/88° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | | **TIME:** | 0600 – 1700 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #12**<br>**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite drainage layer (GDL), continuing from western end of SA-6 South. Material to be placed from Panel #21 (P-21) to approximate Panel #33 (P-33). Based on the PM thunderstorms from 7/30/15, soil subgrade through the utility corridor could not be approved due to soft / wet areas identified. As such, ESI prepped to deploy GDL over the installed geomembrane areas.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI filling sand bags for GVL / geomembrane placement.
- While ESI was filling sandbags, Langan, AmecFW, and Entact conducted a review of the as-built panel layout to confirm repairs and associated panel locations. Once this information was confirmed, ESI began to deploy GDL over the installed geomembrane.
- ESI deployed GDL along the western end of the cap. GDL was placed from approximate Sta. 20+00 (approx. P-21 location) to approx. Sta. 17+00 (approx. P-33 location) which included the placement of 21 rolls (rolls from north to south of SA-6; 28 different panel numbers with butt seams) of GDL from P-21 to P-33. GDL Panels were placed according to the project specifications with white plastic fasteners placed at a maximum of 5 ft. and sewing of the geotextile completed for adjacent geocomposite panels (with orange fabric obtained from extra roll of GDL).
- No geomembrane patch / repair work was conducted as part of the 7/31/15 daily activities. Similarly, no new panels were installed as soil subgrade was not approved.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed for work activities completed on 7/31/15. No geomembrane panels installed, and no patch / repair work or sampling was conducted.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Pending***

- Complete Daily Report and Photo Log (for 7/31/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 1 gas vent).

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-10, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Additional subgrade preparation work to remove soft / wet areas for the next 100 ft. run east (approximately from Sta. 17+00 to Sta. 16+00) through the 1st utility corridor.
- Begin placement of GCL along 1st utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/3/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 73/88° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1945 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #13**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #34 (P-34) installed on 7/29/15 (located at approximate Sta. 17+00) running through first utility corridor approximately 120 ft. east to Sta. 15+80 (to eastern end of 1st utility corridor).
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI placing an additional two panels of GDL (moving east from Panel #33) to cover up to geomembrane Panel #34 (P-34). While GDL was being placed, Langan and Entact conducted soil subgrade approval from approximate Sta. 17+00 to Sta. 15+80 (through 1st utility corridor). Refer to *Soil Subgrade Approval* forms from 8/3/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #1,2, and 3 of the daily photo log for 8/3/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 17+00 to Sta. 15+80 (to eastern side of 1st utility corridor).
- Geocomposite clay liner (GCL), GVL and Cap placement began with ESI placing the GCL along the bottom and slopes of the utility corridor (shown in the *8/3/15 Photo Log*) as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with a granular bentonite. Note: Prior to GCL placement, a soil transition slope (approx. 2 ft. by 2 ft. was constructed along the northern slope of the utility corridor to allow the GCL to transition over the slope without having to conform to the 90 deg. turns of the SCB wall). This soil slope modification was approved prior to construction.
- In addition to the GCL (placed within the utility corridor), 16 oz. geotextile was placed along the boundaries of the SA-6 South Cap (located at the areas above the groundwater table and outside of the GCL) over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/3/15 Photo Log* for supporting photographs.

- After installation of GCL and GVL through the utility corridor, geomembrane cap was installed continuing east of previously installed Panel #34 (located at approximate Sta. 17+00) on 7/29/15. Panels were oriented from east to west through the utility corridor (as proposed in the approved Panel Layout) and were installed through the utility corridor (located at approx. Sta. 16+50) running from the top of the western slope to the top of the eastern slope. Additional panels were installed outside of the utility corridor and were T (butt seamed) into the east-west panels from inside the utility corridor (the panels outside of the utility corridor reverted back to the north-south orientation as indicated on the approved panel layout). A total of twelve panel lengths (different dimensions and sizes) were installed (P-35, P-36, P-37, P-38, P-39, P-40, P-41, P-42, P-43, P-44, P-45, and P-46) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/3), *Trial Weld Log.*
- Installation and welding of the geomembrane panels was conducted until approximately 8 pm to ensure that the utility corridor was properly covered and sealed due to expected overnight storms. As such, no non-destructive testing on the installed panels was conducted. Additionally, no patch / repair work was completed, and no destructive samples were collected. These activities will be completed tomorrow (8/4/15).

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as no patch / repair work was conducted on geomembrane cap.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/3/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-10, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 15+80 to Sta. 14+80) east of utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 8/3/15 |
| A3 – Photo Log | Pages 1 – 8 | Total of 16 photos outlining pertinent daily observations and descriptions for 7/29/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 8/3/15 |
| A5 – Subgrade Approval | Sheet 8 & ESI (8/3/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |
| A6 – Trial Weld Log | Sheet 2 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 8/3/15. |
| A7 – Panel Placement Log | Pages 8 & 9 | One panel placement log provided by ESI and confirmed by Langan for geomembrane placed on 8/3/15 |
| A8 – Destruct Seam Testing COC | | N / A no destruct samples collected on 8/3/15 |
| A9 – Seam/Non-Destruct. Test Log | | N / A no non-destruct tests conducted on 8/3/15 |
| A10 – Repair Log | | N / A no repairs conducted on 8/3/15 |
| A11 – Conformance COC | | N / A for 8/3/15 |
| A12 – Destructive Seam Field Test | | N / A no destruct samples collected on 8/3/15 |
| A13 – Destruct. Sample Summary | | N / A no updates to form (no samples collected on 8/3) |
| A14 – Penetration & Edge Form | | N / A final butyl seal required around boots before log can be completed |
| A16 – Notice of Non-Compliance | | N / A no non-compliance issues identified on 8/3/15 |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | | **DATE:** | 8/4/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 70/85° F, AM Rain, Clear |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | | **TIME:** | 0600 – 1630 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #14**<br>**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from east of Panel #42 installed on 8/3/15 (located at approx. Sta. 15+80) moving east approximately 100 ft. to approximate Sta. 14+80.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Based on the AM storms / rain, ESI could not conduct patch / repair work (i.e. extrusion welding) on the geomembrane panels installed on 8/3/15 due to the inclement weather. Observation of the next section of soil subgrade (approx. Sta. 15+80 to 14+80) was conducted and soft / wet areas were identified with ponding water (due to the storms). As such, soil subgrade was not approved for additional panel placement. Refer to *8/4/15 Photo Log* for subgrade photos. ESI offsite until 12 PM for weather to clear.
- Entact removed the protective plastic layer covering the soil subgrade and conducted drying activities, re-grading, and re-compaction of the soil (as required).
- ESI back onsite at approximately 12 PM to conduct patch / repair work for the panels installed on 8/3/15 (Panels 35-46). Prior to any repair work, trial welding was conducted to confirm that the extrusion welds conformed to the project specifications (refer to *Preweld Test Report* for 8/4/15 for results (extrusion testing identified as EXT. on form).
- A total of forty-one repairs (RP-145 through RP-185) were observed and fixed (according to the project specifications) from Panel #35 through Panel #46 (repair / detailing work conducted on panels installed on 8/3/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs), as well as seam joint repairs where non-destructive testing was conducted along the panel seams. These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications.
- No non-conformance issues were noted as repairs consisted of custom fit design or routine patch / repair work to allow geomembrane to conform to SA-6 contours.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- A total of two destruct samples, DS-11 and DS-12 (fusion weld samples) were collected for laboratory analysis. DS-11 was collected from panel seam 36/37 and DS-12 was collected from panel seam 42/43

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance items observed. Repairs associated with 8/4/15 consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/4/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).
- Review laboratory results for DS-11 and DS-12

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15 as well as reviewed and approved ESI *Daily Panel Placement*, *Preweld Test Report*, and *Certificate of Subgrade Acceptance, etc.* forms.
- Reviewed laboratory destruct sample results for samples DS-1 through DS-10, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

## ***Future Activities Scheduled***

- Additional subgrade preparation work to remove soft / wet areas for the next 80 ft. run east (approximately from Sta. 15+80 to Sta. 15+00) of 1st utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | | **DATE:** | 8/5/2015 |
| **PROJECT:** | SA-6 South Capping | | | **WEATHER:** | 70/84° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | | **TIME:** | 0600 – 1700 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #15**<br>**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #42 (P-42) installed on 8/3/15 (located at approximate Sta. 15+80) running approximately 70 ft. east to Sta. 15+10.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work for three wrinkles (refer to *Repair Log* 8/5/15) that were identified along Panels 35-46 which were placed on 8/3/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/5/15).
- A total of nine repairs (RP-186 through RP-194) were observed and fixed (according to the project specifications) from Panel #35 and Panel #36. As outlined above, these repairs were associated with removing geomembrane wrinkles to allow the cap to conform to the contours of SA-6 South grade. These areas were subsequently patched and sealed with extrusion welds, and confirmed with vacuum box testing being conducted as outlined in the project specifications. Note: no repairs of the geomembrane from 8/5/15 were identified as non-compliance issues.
- Additionally, while the geomembrane was being patched / repaired, ESI also installed the penetration boots for the wells, piezometers, and gas vents protruding through the cap (Note: Penetration logs will be completed once final sealant is placed around top of boot). Orange composite (GDL) was also placed over butt seams of the geocomposite and leistered in place. These patching activities were completed (as needed) to allow Entact to continue placing protective cover soil over the installed GDL along the western end of SA6. The final GDL layer was inspected by Entact and Langan to ensure that all repairs / patches were completed prior to soil placement.
- While patch / repair work was being conducted, Langan and Entact conducted soil subgrade approval from approximate Sta. 15+80 to Sta. 15+10. Refer to *Soil Subgrade Approval* forms from 8/5/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

that the surface was free of any loose material. Refer to Photos #5,6 of the daily photo log for 8/5/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 15+80 to Sta. 15+10.

- Cap placement began with ESI placing the GCL along the southern slope (lower bench along southern end of SA-6 located below the groundwater table) of the southern edge of SA-6 (refer to *8/5/15 Photo Log*) as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with a granular bentonite.
- In addition to the GCL (placed along the southern slope), 16 oz. geotextile was placed along the northern boundary of the SA-6 South Cap, and also along the southern boundary east of the GCL (located at the areas above the groundwater table and outside of the GCL) over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications.
- GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/5/15 Photo Log* for supporting photographs.
- After installation of GCL and GVL along the SA-6 boundaries, geomembrane cap was installed continuing east of previously installed Panel #42 (located at approximate Sta. 15+80) on 8/3/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GCL and GCL layers. A total of three panel lengths were installed (P-47, P-48, P-49) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/5), *Trial Weld Log.*
- Installation and fusion welding of the geomembrane panels was conducted until the end of the work day. As such, no non-destructive testing on the installed panels was conducted. Additionally, no patch / repair work was completed, and no destructive samples were collected. These activities will be completed tomorrow (8/6/15). Note: An extrusion weld sample (DSX-5) was collected from the patch / repair work previously completed on 8/4/15.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as repair work was conducted to remove wrinkles from the cap to allow the geomembrane to properly conform to the contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/5/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).
- Review laboratory data for extrusion destruct sample DSX-5

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, and 8/4/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-12, and DSX-1 through DSX-4. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 15+10 to Sta. 14+10) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/6/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 69/88° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1600 |

| | |
|---|---|
| **CONTRACTOR & EQUIPMENT:**<br>**ENTACT & ESI**<br>*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes) | **PERSONNEL ON SITE:** **Day #16**<br>**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea<br>**Langan:** Dan Bosworth<br>**ENTACT / ESI**: Keith Goisse, Caroline Panico |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #49 (P-49) installed on 8/5/15 (located at approximate Sta. 15+10) running approximately 110 ft. east to Sta. 14+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI placing GDL over the previously installed geomembrane panels from 8/3/15. A total of 10 panel lengths of GDL were placed along the west side of the utility corridor and along the western slope of the utility corridor with end points of the GDL terminating along the approximate center of the utility corridor (east to west orientation). The GDL was placed north to south outside of the corridor and east to west within the corridor and secured with white plastic fasteners spaced at a maximum of 5 ft. and the top layer of geotextile was sewn (according to the project specs).
- While GDL was being placed over the previously installed geomembrane, Langan and Entact conducted soil subgrade approval from approximate Sta. 15+10 to Sta. 14+00. Refer to *Soil Subgrade Approval* forms from 8/6/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #7,8, and 9 of the daily photo log for 8/6/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 15+10 to Sta. 14+00.
- Cap placement began with ESI placing the GCL along the southern slope (lower bench along southern end of SA-6 located below the groundwater table) of the southern edge of SA-6 (refer to *8/6/15 Photo Log*) as shown on the project drawings and outlined in the specifications. The GCL was overlapped a minimum of 1 ft. and was sealed along the seams with granular bentonite.
- Prior to deploying any geomembrane panels over the GCL, it was confirmed that the GCL maintained intimate contact between the material and the HB wall (southern boundary wall). Soil was removed from the top of the sheet piles (as required) by Entact. Refer to Photo #14 of the *Photo Log 8/6/15*.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- In addition to the GCL (placed along the southern slope), 16 oz. geotextile was placed along the northern boundary of the SA-6 South Cap, and also along the southern boundary east of the GCL (located at the areas above the groundwater table and outside of the GCL) over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications.
- GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/6/15 Photo Log* for supporting photographs.
- After installation of GCL, 16 oz. geotextile (along SA-6 boundaries) and GVL, geomembrane cap was installed continuing east of previously installed Panel #49 (located at approximate Sta. 15+10) on 8/5/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GCL and GVL layers. A total of four panel lengths (lengths defined as running the approximate 165 ft. north to south distance of the cap) were installed (P-50, P-51, P-52, P-53, P-54) by ESI. Note: P-51 terminated approximately 6 ft. short of the southern boundary of the SA-6 cap. As such, the remaining section was taken from an additional roll (G15C277060) and labeled as Panel #52 (P-52).
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/6), *Trial Weld Log.*
- Upon panel installation and fusion welding, ESI conducted non-destructive seam testing in accordance with the project specs. No patch / repair work was completed, and no destructive samples were collected as work activities were completed after non-destruct testing was completed. These additional activities will be completed tomorrow (8/7/15).

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as non-destruct testing was in conformance with the project specs and no patch / repair work, or vacuum box testing was conducted on 8/6/15.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/6/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Log (once boot and associated sealing activities are completed for manhole located at Sta. 21+00).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 2 piezometers, and 3 gas vents).

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, and 8/5/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-12, and DSX-1 through DSX-5. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 14+00 to Sta. 13+00) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 8/6/15 |
| A3 – Photo Log | Pages 1 – 7 | Total of 14 photos outlining pertinent daily observations and descriptions for 8/6/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 8/6/15 |
| A5 – Subgrade Approval | Sheet 10 & ESI (8/6/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |
| A6 – Trial Weld Log | Pages 2-3 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 8/6/15. |
| A7 – Panel Placement Log | Page 11 | One panel placement log provided by ESI and confirmed by Langan for geomembrane placed on 8/6/15 |
| A8 – Destruct Seam Testing COC | | N / A no destruct samples collected on 8/6/15 |
| A9 – Seam/Non-Destruct. Test Log | Pages 11-12 | Seam Control Form provided by ESI and confirmed by Langan for non-destruct tests completed on 8/6/15 |
| A10 – Repair Log | | N / A no repairs completed on 8/6/15 |
| A11 – Conformance COC | | N / A for 8/6/15 |
| A12 – Destructive Seam Field Test | | N / A no destruct samples collected on 8/6/15 |
| A13 – Destruct. Sample Summary | | N / A no updates as no destruct samples collected |
| A14 – Penetration & Edge Form | | N / A final butyl seal required around boots before log can be completed |
| A16 – Notice of Non-Compliance | | N / A no non-compliance issues identified on 8/6/15 |

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) continuing from western end of SA-6 South. Material to be placed from Panel #54 (P-54) installed on 8/6/15 (located at approximate Sta. 14+00) running approximately 100 ft. east to Sta. 13+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work along the panels previously installed Panels 50-54 which were placed on 8/6/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/7/15).
- A total of twenty-three repairs (RP-195 through RP-217) were observed and fixed (according to the project specifications) from Panels #50 through Panel #54 (repair / detailing work conducted on panels installed on 8/6/15). The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- One non-conformance issue was observed for a failed vacuum box test during testing of RP-215. The failed weld was patched and re-welded as outlined on Sheet #5.
- A total of three destruct samples were collected (DS-13, DS-14, and DSX-6). DS-13 and DS-14 (fusion) were collected from Panels 47/48 and 50/51, respectively. DSX-6 (extrusion) was collected from Panel #48 on RP-198.
- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for Collection Manhole #2. Note: The penetration log for Collection Manhole #2 will be completed once the boot has been sealed and covered according to the project specifications (to be completed on 8/10/15), and the final sealant is placed around top of boot.
- Langan and Entact conducted soil subgrade approval from approximate Sta. 14+00 to Sta. 13+00 while

patch work was being completed by ESI. Refer to *Soil Subgrade Approval* forms from 8/7/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material.Refer to Photo #6 of the daily photo log for 8/7/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 14+00 to Sta. 13+00.

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 14+00 (east of P-54) moving east (for approximately 100 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/7/15 Photo Log* for supporting photographs.
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #54 (located at approximate Sta. 14+00) on 8/6/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of five panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-55, P-56, P-57, P-58, P-59, P-60) by ESI. Note:, during placement of Panel #55 and #59, the roll of geomembrane was completed, thus, Panel #56 was placed for the last 11 ft. (from roll G15C283029) to complete the southern end and Panel #60 (P-60) was placed for the last 15 ft. (from roll G15C276053) to complete the northern end of SA-6.
- During installation of the Cap, geomembrane seams were overlapped a minimum of 4-inches for fusion welding (according to project specs). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specs. A total of six 1-inch specimens were collected for peel and shear testing (3 samples/each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/7), *Trial Weld Log.*
- Installation and fusion welding of the geomembrane panels was conducted until the end of the work day. Once completed, non-destructive testing on the installed panels was conducted. Non-destruct testing was conducted in accordance with the project specs and is further summarized on the *Seam Control Form (8/7/15).* After non-destructive testing the work day was terminated and no patch / repair work was completed. These activities will be completed on Monday (8/10/15).

## ***Non-Conformance Items / Corrective Actions***

- Non-Conformance No. 5 (Sheet #5) – Failed vacuum box test of RP-215 on *Repair Log*
    - Failed vacuum box test of RP-215 (Panel #50). Failed weld was covered with a new patch and welded (RP-222) as per project specs and further defined in *Sheet 5 Notice of Non-Compliance*

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/7/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 14+35).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-13, DS-14 and DSX-6

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, and 8/6/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-12, and DSX-1 through DSX-5. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 13+00 to Sta. 12+00) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/10/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 69/78° F, Overcast |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1645 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #18**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL) and 60-mil geomembrane liner (Cap) continuing from western end of SA-6 South. Material to be placed from Panel #60 (P-60) installed on 8/7/15 (located at approximate Sta. 13+00) running approximately 100 ft. east to Sta. 12+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work along the panels previously installed Panels 55-60 which were placed on 8/7/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/10/15).
- A total of thirty-one repairs (RP-218 through RP-248) were observed and fixed (according to the project specifications) from Panels #55 through Panel #60 (repair / detailing work conducted on panels installed on 8/7/15). Refer to 8/10/15 *Repair Report.* The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- While the geomembrane was being patched / repaired, ESI also installed a penetration boot for well 115-W5-SO, and completed placing the geomembrane patch around Access Manhole #2. Note: The penetration log for well 115-W5-SO will be completed once the boot has been sealed and covered according to the project specifications and the final sealant is placed around top of boot.
- Langan and Entact conducted soil subgrade approval from approximate Sta. 13+00 to Sta. 12+00 while patch work was being completed by ESI. Refer to *Soil Subgrade Approval* forms from 8/10/15 for additional details. Based on visual inspection, the soil subgrade appeared to be firm and unyielding with no soft / wet areas observed. Furthermore, miscellaneous debris (rocks, debris, etc.) were removed so that the surface was free of any loose material. Refer to Photos #5 and #6 of the daily photo log for 8/10/2015, for supporting subgrade photos. This area was also surveyed to meet the grading requirements as outlined in the project specifications. The soil subgrade inspection sheet was submitted for the approximate area of Sta. 13+00 to Sta. 12+00.

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- GVL and Cap placement began with ESI placing the 16 oz. geotextile at the boundaries of the SA-6 South Cap over the sheet pile and surrounding barrier walls. The geotextile was overlapped approximately 2 ft. outside of the cap (remaining roll width inside), as outlined in the specifications. After the 16 oz. geotextile was placed, GVL was installed from approximate Sta. 13+00 (east of P-60) moving east (for approximately 100 ft.). GVL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/10/15 Photo Log* for supporting photographs.
- After installation of the GVL, geomembrane cap was installed continuing east of previously installed Panel #60 (located at approximate Sta. 13+00) on 8/7/15. Panels were oriented from north to south (as proposed in the approved Panel Layout) and were placed on top of the GVL layers. A total of five panel lengths (panel lengths identified as the approximate 165 ft. run from north to south across SA-6) were installed (P-61, P-62, P-63, P-64, and P-65) by ESI.
- During installation of the Cap, geomembrane seams were overlapped a minimum of four inches for fusion welding (according to project specifications). Prior to welding activities, trial welds (smooth to smooth, texture to texture, and smooth to texture) were conducted to confirm that the equipment met the required specifications. A total of six 1-inch specimens were collected for peel and shear testing (3 samples for each test). The results of the pre-trial weld are provided in the associated QA form submitted for today (8/10), *Trial Weld Log.*
- Installation and fusion welding of the geomembrane panels was conducted until the end of the work day. Once completed, non-destructive testing on the installed panels was conducted. Non-destruct testing was conducted in accordance with the project specs and is further summarized on the *Seam Control Form (8/10/15).* After non-destructive testing the work day was terminated and no patch / repair work was completed.
- A total of three destructive samples were collected (two fusion and one extrusion weld). Fusion weld destruct samples (DS-15, DS-16) were collected from Panel Seams 54/55 and 59/61 respectively. DSX-7 was collected along Panel 53/54 seam. Destruct samples were collected at 500 LF intervals and in accordance with the project specs.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues were recorded as non-destructive testing was in conformance with the project specs and patch / repair work consisted of custom fit design to allow geomembrane to conform to SA-6 contours.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/10/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-15, DS-16, DS-17, and DSX-7

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, and 8/7/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-14, and DSX-1 through DSX-6. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

***Near Misses / Incidents***

- None Encountered

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 12+00 to Sta. 11+00) continuing east along SA-6.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.

***Daily QA Documents Completed***

| ***Appendix / QA Forms*** | ***Sheet / Page Numbers*** | ***Comments*** |
|---|---|---|
| A1 – Certificate of Completion | | To be completed at termination of project |
| A2 – Receiving and Inspection | | N / A – no material delivered on 8/10/15 |
| A3 – Photo Log | Pages 1 – 7 | Total of 14 photos outlining pertinent daily observations and descriptions for 8/7/15 |
| A4 – Geosynthetic Inventory Log | | Completed to date; no updates from 8/10/15 |
| A5 – Subgrade Approval | Sheet 12 & ESI (8/10/15) | Two subgrade approval forms provided. One by Independent QA and one from Geosynthetic Installer. |
| A6 – Trial Weld Log | Page 3 | One trial weld log provided by ESI and confirmed by Langan for prewelds completed up to 8/10/15. |
| A7 – Panel Placement Log | Page 13 | One panel placement log provided by ESI and confirmed by Langan for geomembrane placed on 8/10/15 |
| A8 – Destruct Seam Testing COC | Page 1 | Updated with destruct samples collected on 8/10/15 |

# SITE OBSERVATION REPORT

| | | | | | |
|---|---|---|---|---|---|
| **PROJECT No.:** | 10053001 | **CLIENT:** Honeywell International, Inc. | **DATE:** | 8/12/2015 |
| **PROJECT:** | SA-6 South Capping | | **WEATHER:** | 71/83° F, Clear, Sunny |
| **LOCATION:** | 60 Kellogg St., Jersey City New Jersey | **TASK.:** Geocomposite & Cap Placement | **TIME:** | 0600 – 1630 |

**CONTRACTOR & EQUIPMENT:**
**ENTACT & ESI**
*Equipment:* Dozers, Steel Drum Rollers, Skytrak 10 Forklift, Deere 333E Bobcat, Misc. Hand Tools (shovels, rakes)

**PERSONNEL ON SITE:** **Day #19**
**AmecFW**: Stu Bills, Geoff Shallard, Dave Ambrose, Ari Eslaminejad, Brian Shea, Philemon Onyango
**Langan:** Dan Bosworth
**ENTACT / ESI**: Keith Goisse, Caroline Panico

## ***Site Activities***

- Langan onsite for observation of placement of geocomposite venting layer (GVL), 60-mil geomembrane liner (Cap), and geocomposite drainage layer (GDL) continuing from western end of SA-6 South. Material to be placed from Panel #65 (P-65) installed on 8/10/15 (located at approximate Sta. 12+00) running approximately 100 ft. east to Sta. 11+00.
- Prior to Site activities, a daily health & safety (H&S) tailgate meeting was conducted with onsite personnel and contractors regarding work to be completed and potential hazards / complications that may be encountered during daily activities. Appropriate personal protective equipment (PPE) was donned (hard hat, safety vest, gloves, eyeglasses, and tyvek suit) prior to entering the work area (SA-6 capping area). It should be noted that after GVL has been placed on SA-6, modified level D PPE (tyvek suit, rubber boots, etc.) was not required.
- Site activities commenced with ESI conducting patch / repair work along the panels previously installed Panels 61-66 which were placed on 8/10/15. Prior to repair work a preweld test was conducted to confirm the extrusion welds met the requirements of the project specs. Refer to *Preweld Trial Log* (8/12/15).
- A total of four repairs (RP-249 through RP-252) were observed and fixed (according to the project specifications) from Panels #64 through Panel #66 (repair / detailing work conducted on panels installed on 8/10/15). Refer to 8/12/15 *Repair Report* for supporting information. The majority of these repairs were cuts that were made on the geomembrane to allow the cap to conform to the contours of SA-6 South grade (custom fit repairs). These areas were subsequently patched and sealed with extrusion welds, with vacuum box testing then conducted as outlined in the project specifications.
- While the geomembrane was being patched / repaired, ESI also installed / construction penetration boots for well 115-W5-SO and gas vent #5 (GV-5). Note: These penetration logs will be completed once the final clamps and seal (butyl seal) have been completed according to the project specifications and the final sealant is placed around top of boot.
- While ESI was conducting repair / patch work, Langan and Entact conducted soil subgrade observation from approximate Sta. 12+00 to Sta. 11+00. Based on visual inspection, the soil subgrade appeared to contain areas of soft / wet subgrade due to rainstorms from 8/11/15. Based on these soft areas, soil subgrade was not approved for geomembrane placement. Entact conducted additional preparation work (i.e. drying the soil and re-grading and re-compacting) as required, to conform the subgrade to the project specifications (refer to Photo #7 of the daily photo log for 8/12/15)

Cc Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

- After completing patch / repair work from the panels installed on 8/10/15, ESI began to place GDL continuing east along the utility corridor. GDL was placed along the eastern slope of the utility corridor (located at approximate Sta. 16+50). Panels were oriented east to west within the utility corridor, and reverted back to the north and south orientation outside of the corridor (refer to the *8/12/15 Photo Log* for supporting photos)
- GDL was placed according to the project specifications with white plastic fasteners spaced at a maximum of 5 ft. Additionally, the top panel of geotextile was sewed along the seams (according to the project specifications). Refer to *8/12/15 Photo Log* for supporting photographs.
- No new geomembrane panels were placed as the soil subgrade for the next 100 ft. section was not approved. No destruct samples were collected, as DS-17 was collected on 8/10/15 during panel placement.
- Additionally, Entact placed protective cover soil over the previously installed geomembrane and GDL panels at the western end of SA-6. Protective cover soil was placed in 1 ft. lifts with caution tape placed at a maximum of 5 ft. spacing, placed over the GDL prior to soil placement.

## ***Non-Conformance Items / Corrective Actions***

- No non-conformance issues recorded as no new geomembrane panels were placed and the patch / repair work conducted on geomembrane cap was in compliance with the project specifications.

## ***Action Items – Pending***

- Complete Daily Report and Photo Log (for 8/12/15). Review and confirm supporting QA paperwork (Soil subgrade approval, trail weld log, panel placement, notice of non-compliance, etc.).
- Complete Collection Manhole Penetration Logs for Manhole #1 (once boot and associated sealing activities are completed for manhole located at Sta. 21+00), and Manhole #2 (once concrete extension is added and the manhole is clamped and sealed – located at approximate Sta. 15+70).
- Complete Well / Piezometer Penetration Logs (once clamps and gaskets have been installed for 2 wells, 3 piezometers, and 3 gas vents).
- Review laboratory results for DS-17 (once received)

## ***Action Items – Weekly Completions***

- Completed Daily Report, Photo Log, and Soil Subgrade Approval for 7/20/15, 7/21/15, 7/22/15, 7/23/15 and 7/24/15, 7/27/15, 7/28/15, 7/29/15, 7/30/15, 7/31/15, 8/3/15, 8/4/15, 8/5/15, 8/6/15, 8/7/15, and 8/10/15 as well as reviewed and approved daily ESI form submittals (i.e. Subgrade, Panel Placement, etc.)
- Reviewed laboratory destruct sample results for samples DS-1 through DS-16, and DSX-1 through DSX-7. Laboratory results in compliance with shear and peel requirements as outlined in project specifications.

## ***Near Misses / Incidents***

- None Encountered

Cc: Jeff Stoicescu, Rory Johnston, Geoff Shallard, Stu Bills, Dave Ambrose

By: Dan Bosworth

**Langan Engineering, Environmental, Surveying and Landscape Architecture, D.P.C.**

***Future Activities Scheduled***

- Continue subgrade preparation work for the next approximate 100 ft. run east (approximately from Sta. 12+00 to Sta. 11+00) east of utility corridor.
- Continue with GVL and Geomembrane Cap placement moving east along SA-6 South.
